In cooperation with the Regents of the University of California and the United States Department of the Interior, Fish and Wildlife Service

Soil Survey of Butte Area, California, Parts of Butte and Plumas Counties

How To Use This Soil Survey

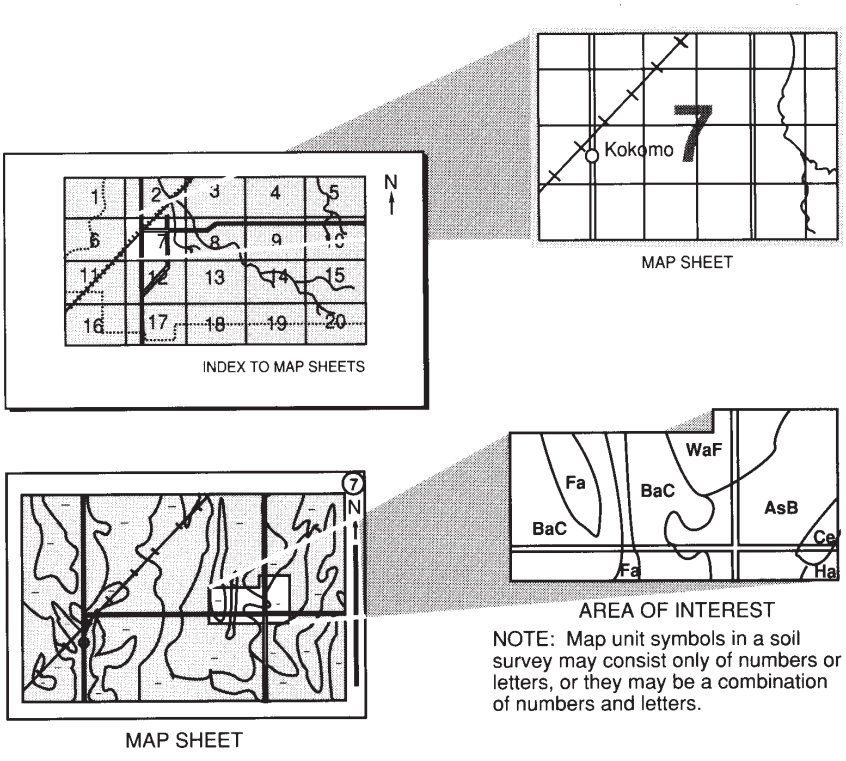
General Soil Map

The general soil map shows the survey area divided into groups of associated soils called general soil map units. This map is useful in planning the use and management of large areas. To find information about your area of interest, locate that area on the map, identify the name of the map unit in the area on the color-coded map legend, then refer to the section **General Soil Map Units** for a general description of the soils in your area.

Detailed Soil Maps

The detailed soil maps can be useful in planning the use and management of small areas. To find information about your area of interest, locate that area on the **Index to Map Sheets**. Note the number of the map sheet and turn to that sheet. Locate your area of interest on the map sheet. Note the map unit symbols that are in that area. Turn to the **Contents**, which lists the map units by symbol and name and shows the page where each map unit is described.

The **Contents** shows which table has data on a specific land use for each detailed soil map unit. Also see the **Contents** for sections of this publication that may address your specific needs.



National Cooperative Soil Survey

This soil survey is a publication of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey. This survey was made cooperatively by the Natural Resources Conservation Service; the Regents of the University of California; and the United States Department of the Interior, Fish and Wildlife Service. The survey is part of the technical assistance furnished to the Butte County, Feather River, and Vina Resource Conservation Districts.

Major fieldwork for this survey was completed in 2001. Soil names and descriptions were approved in 2005. Unless otherwise indicated, statements in this publication refer to conditions in the survey area in 2001. The most current information is available through the NRCS Soil Data Mart Web site or the NRCS Web Soil Survey. The Soil Data Mart is the data storage site for the official soil survey information.

Soil maps in this survey may be copied without permission. Original soil survey maps were prepared at publication scale. Viewing scale and printing scale, however, may vary from the original. The bar scale on each map sheet indicates the proper map measurements.

Nondiscrimination Statement

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, or political beliefs. USDA also prohibits discrimination in the form of reprisal and in situations where all or part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Caption for Cover Photo

Big Chico Creek Canyon in the vicinity of Upper Bidwell park. At the right in the foreground is rock outcrop composed of Tuscan mudflow breccia. In the center, Big Chico Creek has cut through an exposure of Lovejoy basalt and created a narrow slot canyon.

Additional information about the Nation's natural resources is available online from the Natural Resources Conservation Service at http://www.nrcs.usda.gov.

175—Farwell clay loam, 0 to 1 percent slopes 136
176—Farwell loam, 0 to 1 percent slopes, occasionally flooded 137
176yu—Jocal loam, 8 to 15 percent slopes 139
177—Farwell silt loam, 0 to 1 percent slopes, occasionally flooded 140
178—Arbuckle gravelly loam, 0 to 2 percent slopes 142
179—Moda taxadjunct-Arbuckle complex, 0 to 2 percent slopes 143
180—Dodgeland silty clay loam, 0 to 5 percent slopes, occasionally flooded 145
181—Dodgeland silty clay loam, 0 to 1 percent slopes, frequently flooded 147
188yu—Mariposa taxadjunct gravelly loam, 15 to 30 percent slopes 149
189—Esquon silt loam, 0 to 1 percent slopes, overwash 150
189yu—Mariposa taxadjunct gravelly loam, 30 to 50 percent slopes 151
196yu—Mildred cobbly loam, 30 to 50 percent slopes 152
200—Parrott silt loam, 0 to 2 percent slopes, occasionally flooded 154
201—Parrott silt loam, 0 to 2 percent slopes, frequently flooded 155
203—Kusalslough silty clay loam, 0 to 1 percent slopes, occasionally flooded 157
205—Parrott-Vermet complex, 0 to 2 percent slopes, frequently flooded 158
206—Islandbar-Chawanakee complex, 3 to 15 percent slopes 160
207—Islandbar-Chawanakee complex, 15 to 30 percent slopes 163
208—Islandbar-Chawanakee complex, 30 to 50 percent slopes 165
209—Islandbar-Chawanakee complex, 50 to 70 percent slopes 167
210—Featherfalls-Islandbar complex, 2 to 15 percent slopes 169
211—Featherfalls-Islandbar complex, 15 to 30 percent slopes 171
212—Featherfalls-Islandbar complex, 30 to 50 percent slopes 174
213—Featherfalls-Islandbar complex, 50 to 70 percent slopes 176
214—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 2 to 15 percent slopes 178
215—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 15 to 30 percent slopes 181
216—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 30 to 50 percent slopes 184
217—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 50 to 70 percent slopes 187
218—Rock outcrop-Lithic Xerorthents-Chawanakee complex, 12 to 50 percent slopes 190
219—Rock outcrop-Lithic Xerorthents-Chawanakee complex, 50 to 70 percent slopes 192
220—Esquon-Clear Lake complex, 0 to 1 percent slopes, frequently flooded 194

221yu—Sites loam, 3 to 8 percent slopes 196
222yu—Sites loam, 8 to 15 percent slopes 197
225yu—Sites gravelly loam, bedrock substratum, 3 to 8 percent slopes 199
226yu—Sites gravelly loam, bedrock substratum, 8 to 15 percent slopes 200
227yu—Sites gravelly loam, bedrock substratum, 15 to 30 percent slopes 201
242yu—Surnuf gravelly loam, 8 to 15 percent slopes 203
243yu—Surnuf gravelly loam, 15 to 30 percent slopes 204
244yu—Surnuf gravelly loam, 30 to 50 percent slopes 206
245—Surnuf gravelly loam, 50 to 70 percent slopes 207
248yu—Trainer loam, 0 to 1 percent slopes, occasionally flooded 208
250—Llanoseco silty clay loam, 0 to 2 percent slopes, occasionally flooded 210
252—Whitecabin-Ordferry silty clays, 0 to 1 percent slopes, occasionally flooded 211
252yu—Woodleaf gravelly loam, 3 to 15 percent slopes 214
253yu—Woodleaf gravelly loam, 15 to 30 percent slopes 215
255—Whitecabin-Ordferry complex, 0 to 1 percent slopes, occasionally flooded 216
256—Whitecabin silt loam, 0 to 1 percent slopes, occasionally flooded 219
257—Llanoseco silty clay loam, 0 to 1 percent slopes, frequently flooded 220
258—Codora silty clay loam, 0 to 1 percent slopes, occasionally flooded 222
260—Ordferry silty clay, 0 to 1 percent slopes, occasionally flooded 223
280—Columbia taxadjunct very fine sandy loam, 0 to 1 percent slopes, frequently flooded 225
290—Perkins gravelly loam, 0 to 2 percent slopes 226
300—Redsluff gravelly loam, 0 to 2 percent slopes 228
301—Wafap-Hamslough complex, 0 to 2 percent slopes 229
302—Redtough-Redswale complex, 0 to 2 percent slopes 232
303—Munjar-Tuscan taxadjunct-Galt complex, 0 to 2 percent slopes 235
304—Redtough loam, 8 to 35 percent slopes 238
305—Redtough-Redswale-Anita, gravelly duripan, complex, 0 to 5 percent slopes 239
306—Duric Xerarents complex, 0 to 1 percent slopes 242
307—Duric Xerarents, 0 to 1 percent slopes 244
310—Kimball loam, 1 to 3 percent slopes 245
317—Thompsonflat loam, 2 to 15 percent slopes 247
318—Thompsonflat-Oroville complex, 0 to 9 percent slopes 248
320—Vistarobles-Redding complex, 0 to 9 percent slopes 250
321—Durixeralfs-Typic Petraquepts complex, 0 to 2 percent slopes 253
330—Wilsoncreek-Trainer loams, 0 to 2 percent slopes, occasionally flooded 255
331—Thompsonflat loam, 15 to 30 percent slopes 257
335—Galt clay loam, 0 to 1 percent slopes 259
336—Galt clay, 0 to 1 percent slopes 260
337—Galt clay loam, 0 to 1 percent slopes, leveled 262
338—Oxyaquic Xerofluvents silt loam, 0 to 1 percent slopes 263
339—Oxyaquic Xerofluvents sandy loam, 0 to 1 percent slopes, frequently flooded 264
340—Rock outcrop-Thermalrocks-Campbellhills complex, 2 to 15 percent slopes 266
341—Elsey-Beatsonhollow-Campbellhills-Rock outcrop complex, 2 to 5 percent slopes 268

Foreword

Soil surveys contain information that affects land use planning in survey areas. They include predictions of soil behavior for selected land uses. The surveys highlight soil limitations, improvements needed to overcome the limitations, and the impact of selected land uses on the environment.

Soil surveys are designed for many different users. Farmers, ranchers, foresters, and agronomists can use the surveys to evaluate the potential of the soil and the management needed for maximum food and fiber production. Planners, community officials, engineers, developers, builders, and home buyers can use the surveys to plan land use, select sites for construction, and identify special practices needed to ensure proper performance. Conservationists, teachers, students, and specialists in recreation, wildlife management, waste disposal, and pollution control can use the surveys to help them understand, protect, and enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. The information in this report is intended to identify soil properties that are used in making various land use or land treatment decisions. Statements made in this report are intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

These and many other soil properties that affect land use are described in this soil survey. Broad areas of soils are shown on the general soil map. The location of each soil is shown on the detailed soil maps. Each soil in the survey area is described, and information on specific uses is given. Help in using this publication and additional information are available at the local office of the Natural Resources Conservation Service or the Cooperative Extension Service.

Soil Survey of Butte Area, California, Parts of Butte and Plumas Counties

By Dean W. Burkett and Andrew E. Conlin, Soil Scientists, Natural Resources Conservation Service

Major fieldwork and mapping by Andrew E. Conlin, Dean W. Burkett, Felix J. Panlasigui, Jr., Beverly Gularte Harben, William R. Reed, Steven J. Borchard, and Brad L. Rust, Soil Scientists, Natural Resources Conservation Service

Technical support and quality assurance provided by Susan Southard, Soil Data Quality Specialist; vegetation and forest production data provided by Charles Diehl, Forester, Natural Resources Conservation Service; block diagrams provided by Andrew Conlin and David Howell, Soil Scientists, Natural Resources Conservation Service; and manuscript assistance provided by Jennifer Anderson, Soil Scientist, Natural Resources Conservation Service

Fieldwork contributions by Ken Simeral, Foster Fell, John Schlegal, John Osborn, Cheryl Zelus, Joe Jahnke, John Rule, Charles Ferrari, Steven Slusser, and David Howell, Soil Scientists, Natural Resources Conservation Service

United States Department of Agriculture, Natural Resources Conservation Service, in cooperation with
Regents of the University of California and the United States Department of the Interior, Fish and Wildlife Service

This soil survey updates the “Reconnoissance Soil Survey of the Sacramento Valley, California” (USDA, 1915); the “Soil Survey of the Chico Area, California,” (USDA, 1929); the “Soil Survey of the Oroville Area, California” (USDA, 1930); the “Report for General Soil Map, Butte County, California” (USDA, 1967); and the “Soil-Vegetation Survey” maps and reports published from 1974 through 1981 (California Division of Forestry and Fire Protection). It provides additional coverage and information and has larger maps, which show the soils in greater detail.

The survey area includes parts of Butte and Plumas Counties (fig. 1). It has a total of 930,752 acres, or about 1,454 square miles. It is bordered on the north by Tehama County, on the west by Glenn County, on the southwest by Colusa and Sutter Counties, on the southeast by Yuba County and the Plumas National Forest, and on the northeast by the Lassen National Forest.

General Nature of the Survey Area

This section gives general information about the survey area. It describes physiography, relief, and drainage; history and development; and climate.

Figure 1.—Location of the survey area in California.

Physiography, Relief, and Drainage

The Butte area is within the Great Valley, Sierra Nevada, and Southern Cascades geomorphic provinces. The survey area consists of several physiographic units. These units are the Sacramento Valley, in the western part of the survey area; the Southern Cascade and Sierra Nevada foothills, in the central part; and the Southern Cascade and Sierra Nevada Mountains, in the eastern part.

The *Sacramento Valley* is nearly level and is made up of several distinct landforms. These are the flood plains along the Sacramento and Feather Rivers, basins, alluvial fans, and terraces. Within the survey area, the Sacramento Valley is approximately 10 to 20 miles wide and about 44 miles long. Elevation ranges from 55 feet in the Butte Sink to 495 feet on the terraces east of Oroville. Slow-moving creeks originating in the eastern mountains flow in a southwesterly or southerly direction through the Sacramento Valley and terminate at either the Sacramento River or the Feather River. Generally, there is little runoff throughout the area because slopes are nearly level. Flood plains naturally have bar-and-channel topography because of alternating periods of sediment deposition and removal by floodwater. Most areas have been leveled for agricultural production because of the excellent soil properties on the flood plains. All areas of the alluvial sediment that builds up to form the flood plains are internally drained. Floodwaters pass over the top of the flood plains. When the water level in the main channel recedes, the water on the flood plains drains readily in most areas. The Butte Basin naturally was internally drained, but it is now artificially drained by canals and ditches that serve to provide both drainage and irrigation for rice production. The alluvial fans are depositional landforms with very deep, well drained soils that allow water to readily percolate downward through the profile; therefore, runoff is negligible. Because of manipulation of creeks for flood control and irrigation supply, most creeks presently flow through the alluvial fans in one well defined channel. Little sediment is deposited on the adjacent surface. The alluvial terraces are nearly level to hilly and have mound-swale microtopography. The soils are underlain by

either a duripan or densic material; therefore, drainage is restricted and the soils are seasonally saturated. Runoff can be very high.

The *Southern Cascade foothills* are very distinctive as compared with the Sierra Nevada foothills. Though not officially recognized at the major land resource area (MLRA) level as a separate part of the foothills, the Southern Cascade foothills have a quite different topography. The Southern Cascade foothills in the survey area consist of a repeating pattern of nearly level to moderately sloping ridges interrupted by moderately sloping to very steep canyon slopes and canyon bottoms. Elevation ranges from 160 to 2,595 feet. This landscape is about 8 to 12 miles wide and about 24 miles long and has ridges and canyons trending towards the southwest. The ridges consist mainly of mudflow breccia, volcanic sandstone, and volcanic conglomerate making up the Tuscan Formation and originating from Mount Yana (Lydon, 1968). Cohasset Ridge is the one exception. It consists of Cohasset basalt. Canyons are the result of downcutting of the Tuscan Formation by streams over the last million years. From north to south, the main ridges are Keefer, Cohasset, Musty Buck, Doemill, Coon, McKay, Perkins, and Morgan and the main canyons are Sheephollow, Cabin Hollow, Nance, Nugen, Hamlin, Hayes, Berry, Cory, and Horsethief. The Southern Cascade foothills are drained by numerous creeks, including Pine, Rock, Mud, Sycamore, Big Chico, Little Chico, Butte, Little Butte, Little Dry, Clear, and Dry Creeks.

The *Sierra Nevada foothills* are south of the Southern Cascade foothills. The survey area includes the most northerly portion of the Sierra Nevada foothills, which extend south for approximately 360 miles. The landscape occurs at the west-side toe of the fault-block Sierra Nevada Mountain Range and consists of gently sloping to very steep, dissected hills and some deeply dissected river canyons. This landscape is approximately 6 to 16 miles wide and 18 miles long within the survey area. Elevation ranges from about 245 to 2,600 feet.

Local geology has the greatest influence on the topography and determines the trend of slopes and drainage. Table Mountain is made up of Lovejoy basalt and occurs as a gently sloping, slightly tilted basalt plateau with a relatively flat top interrupted by nearly vertical cliffs and canyons on the west side. The canyons formed during times of much greater precipitation. Water flowing across the basalt plateau reached the edge, cascaded over the cliff, and cut into soft sediments of the Ione Formation. The Ione sediment was washed away from underneath the basalt, which eventually became unsupported and tumbled below. The plateau is cutting slowly backward, forming the canyon. In the area that is on the green schist portion of the Smartville Formation (Shiffman and Wagner, 1992), ridges are oriented from north to slightly southeast. Areas on the Bald Rock and Swedesflat plutons tend to have little overall orientation and are dissected in nearly every direction.

Most of the streams flow from the east towards the southwest. The waters of Lake Oroville hide the deeply dissected canyons of the North, Middle, and South Forks of the Feather River. The natural river bottom lies approximately 600 feet below the water at Oroville Dam when the lake is at full capacity.

The *Southern Cascade Mountains* are generally north of the Sierra Nevada Mountains. Volcanic flows have flowed over the top of, or buried, the Sierra Nevada Mountains. The survey area includes the most southerly extension of the Southern Cascade Mountains, which extend north about 150 miles and terminate near the California-Oregon border. The Southern Cascade Mountains consist of gently sloping to strongly sloping ridges interrupted by moderately steep to very steep canyon side slopes and narrow canyon bottoms. Slopes in the canyons are generally complex, and slopes on the ridgetops tend to appear smooth to rolling when observed from a distance. This landscape is about 14 to 20 miles wide and about 4 to 10 miles long. Elevation ranges from about 1,200 to 5,700 feet. Ridges and canyons are oriented from the north to the southwest. From north to south, the main ridges are Cohasset, Musty Buck, Doemill, Portuguese Point, Carpenter, Nimshew, and Paradise. The

bedrock in this area includes Pliocene-age volcanic rocks, such as mudflow breccia, andesite, and some basalt. The area is drained by Big Chico, Little Chico, and Butte Creeks and their tributaries.

The *Sierra Nevada Mountains* are south of the Southern Cascade Mountains and include the most northerly portion of the Sierra Nevada Mountain Range. The rest of the range extends south for about 340 miles. The survey area occurs entirely on the west slope, which is characterized by a system of ridges and associated canyons and some mountain valleys. This mountainous relief has complex slopes, ranging from gently sloping ridgetops to very steep slopes that commonly exceed 70 percent in canyons. The Sierra Nevada is considered a fault-block mountain range, which means that when tectonic or fault activity takes place, the entire range moves as one block. This kind of movement is the explanation for the long, gently sloping west slope and the abrupt escarpment of the east slope. The landscape is about 16 to 18 miles wide and about 36 miles long. Elevation ranges from about 1,400 to 6,100 feet within the survey area. Because of high amounts of precipitation, much of it occurring as snow, runoff is high. Many tributary creeks drain the area, and most flow quickly downstream to become major rivers, such as the West Branch and North, Middle, and South Forks of the Feather River. The watershed that is drained is huge, and most of the water is captured in Lake Oroville and used by the State Water Project, which provides water for both domestic and agricultural uses for much of the State.

The bedrock of the Sierra Nevada is quite variable and includes intrusive igneous rocks, such as quartz diorite, diorite, and gabbro on plutons; metamorphic rocks, such as metasediments, green schist, conglomerate, and various metavolcanic rocks; and extrusive igneous rocks, such as basalt, andesite, and mudflows on ridgetops. At the highest elevations, glacial till is made up of both intrusive and extrusive igneous rocks.

History and Development

Prepared by Robert E. Colby, Historian, Magalia, California.

Archaeological evidence indicates that some 13,000 years ago people were living in what became California. Apparently, the Northeastern Maidu were among these earliest residents. These early people seldom traveled more than a few miles from where they were born because they had all the essentials for their way of life close at hand.

Butte County now covers the traditional lands the Konkow, commonly known as Maidu, Northwestern Maidu, or Konkow Maidu. Various villages made for a rich diversity of tribes speaking many different dialects and having diverse lifestyles, material cultures, social customs, and political organizations. For millennia, the indigenous people in this area used the wide array of the county's flora and fauna as sources of food, medicine, basketry, weapons, tools, games, shelter, and ceremonial items, generating a long-term history with the land. This enduring connection between the Maidu and plants not only conserved plant populations but also preserved desirable characteristics of individual plants. The people managed plant mosaics on a large scale, to attract wild game, to minimize potential catastrophic fires, and to provide a diversity of food crops. Maidu descendants from these villages still gather in and tend wild areas in Butte County, adhering to ancient rules and techniques that allow resource use while keeping the resource base intact.

As Euro-American settlers multiplied, forces of change grew steadily and affected all aspects of the traditional indigenous culture and lifestyle. Many individuals were forced to move into the new non-Indian settlements, and the population of the indigenous people plummeted through disease, genocide, starvation, and warfare. In spite of their losses, the indigenous people have maintained their distinct ethnic identity and have taken steps in the political, economic, and social rebuilding and

restoration of the original people of the region. Given the great obstacles the people have had to face, the continuance of the Maidu traditions is remarkable.

In 1808, Gabriel Moraga and Spanish soldiers were the first Europeans to see the buttes rising from the valley floor for which the county would later be named. In 1820, Louis G. Arguello, exploring for the Governor of Spanish California, arrived in the Oroville area, where he named the Rio de Las Plumas, or Feather, River. He chose this name because of the quantity of wildfowl feathers floating on the surface.

Apparently, the first Americans to arrive in the survey area were Jedediah Smith and a party of trappers in 1827 and 1828. They trapped as far north as Butte and Chico Creeks before heading on into Oregon. In 1829, trappers from the American Fur Company and the Hudson's Bay Company apparently reached this area from the north as far as the Sutter Buttes.

In 1843, John Bidwell, who became Butte County's most notable resident, traveled throughout the area while in the employ of John Sutter. Bidwell was so taken by what he saw around Chico Creek that he mapped the various streams and canyons. In 1849 and 1850, he purchased part of a Spanish Land Grant called the "Rancho Arroyo del Chico," over 22,000 acres along Chico Creek. By 1847, Bidwell had established an extensive farm. In 1860, he founded the town of Chico on his property. By 1844, Sam Neal, another Butte County pioneer, had received the Esquon Land Grant, along Butte Creek, from the Mexican Government of California.

John Bidwell is credited as being the first to find gold on the banks of the Feather River, near what would become the town of Hamilton. This discovery occurred in 1848, and Bidwell followed the river upstream to what became Bidwell's Bar. He made his fortune at this location and began the Gold Rush in what would be called the Northern Mines. He used part of the gold he mined to purchase the Chico ranch. Shortly after Bidwell's strike, there were numerous gold camps along the branches of the river, and flour soon cost $800 a barrel.

Butte County was one of the original 27 California counties formed in 1850. It originally extended from the Sacramento River to the California-Nevada border and was about four times larger than the approximate 1,700 square miles it is today. In the middle of the 1850s, all of Plumas County was carved out of Butte County and other parts were given to Tehama, Lassen, Colusa, and Sutter Counties. Ironically, the Sutter Buttes, for which Butte County is named, are no longer in the county.

By the early 1850s, the Gold Rush for the individual miner was mostly over. All the "easy pickin's" were gone, and most miners had to find work with operations that had the financing to mine on a large scale. Most of the early gold camps were gone. Some resurrected themselves, as did the 1849 camp of Ophir, which was incorporated as Oroville in 1856. In the election of 1850, Bidwell's Bar became the county seat. There was an acrimonious debate about the county seat with the town of Hamilton and then for decades between Oroville and Chico. In 1853, the "Butte Record," the county's first newspaper, was published at Bidwell's Bar.

Gold mining put Butte County on the map. On February 18, 1898, the "Chico Record" stated that between 1848 and 1898 "more than $200,000,000 (in gold) have been taken out of Butte County's placer gravel and quartz mines." It is estimated that as much as 10 million dollars worth of gold was recovered in 1848 alone. The 54-pound Dogtown nugget was the most notable find in 1859. Dogtown-Magalia was one of the most prolific placer and drift mining areas in the State. Forbestown and Concow were hard rock mining areas. Butte Creek was mainly placer deposits. It was eventually dredged. Bidwell's Bar and most of the Feather River, including Ophir-Oroville, were known for placer deposits. Although diamonds were found in its gold-bearing gravel, Cherokee was most famous as a hydraulic mine.

A very efficient way to mine gold on a large scale, hydraulic mining started about 1858. Farmlands were inundated by the "slickins" (debris), and navigation on rivers as big as the Sacramento was impaired. This form of mining was so strictly regulated by

1883 that it virtually disappeared. Butte County had numerous hydraulic mines, the most notable being the Cherokee mine. Starting in 1870, the Spring Valley Mining Company constructed a vast network of ditches and flumes, one 30 miles long, to bring water to the 18 monitors that shot water 400 feet into gold-bearing gravel, washing debris into 3 miles of sluice boxes from which the gold was picked. Four million gallons of water were used each day. Ditches to carry water to the mines were nothing new in the county. The county had 167 miles of ditches by 1861 and 400 miles by 1877. Many of the ditches would be used later to carry water for agriculture and hydroelectric power generation. In 1877, the first crude gold dredge was used in the Feather River. By the early 1900s, this was the dominant method of mining on the rivers and creeks in the county.

The Chinese came to Butte County during the Gold Rush, approximately 10,000 coming to Oroville alone. As elsewhere within the gold fields of California, they proved to be diligent miners, more so than many of the other miners. Many later worked on the various trans-Sierra railroads.

As mines and early towns appeared in 1849, so did a crude system of roads. By 1851, there were established routes used by stages, teamsters, and the ordinary citizens. One of the earliest roads was the Beckwourth Trail, which came from the California-Nevada border through the American Valley and over the Sierra Nevada to Bidwell's Bar. Highway 162 follows the general route today. In 1855, local citizens built Bidwell's Bar Bridge over the Middle Fork of the Feather River. Shipped around the Horn in pieces, this was the first suspension bridge in California. Ironically, the bridge was built about the time that Bidwell's Bar declined and mining, as well as the newspaper, moved downstream to Ophir-Oroville. Streets were laid out in Chico in 1860, and the Marysville-Shasta Stage Road established scheduled travel between central and northern California and Oregon. Shallow-draft steamboats traveled the Sacramento River by 1862, making stops in Butte County. The Humboldt Road was opened from Chico to mines in Nevada and Idaho in 1865. In 1870, the California and Oregon Railroad reached Chico from the north and continued south to Marysville and beyond. The California Northern Railroad came northward from Marysville to Oroville. In 1906, the Western Pacific Railroad started construction of a rail line through the canyon of the North Fork of the Feather River, and passenger service began in 1910. Construction on the Feather River Highway through the canyon started in 1928, and the road was opened in 1937.

Except for the larger land grants in the valley that raised wheat, hay, and cattle, agriculture was of limited importance until the 1860s. It was found, though, that the soils of the county supported many of the crops that grow in California, including grains of all kinds, citrus fruits, olives, almonds, grapes, berries, melons, sugar beets, hops, and flax. The adobe soils around Nelson produced large amounts of wheat and other grains, and from 1850 to 1870, this area was a major producer of grains. An olive orchard was planted in the 1870s near Wyandotte, and the number of orchards increased in the Oroville area through the 1890s. The olive industry really did not "blossom" until Mrs. Freda Ehmann moved to Oroville in 1893. Starting with 20 acres of olive trees near Marysville, she built an olive growing and canning business in Oroville that shipped her olives throughout California, the nation, and the world.

The citrus industry began in the middle of the 1850s. The famous Mother Orange Tree was planted next to Bidwell's Bar Bridge in 1856-57. Contrary to local folklore, this tree did not produce the first orange grown in California and may have been of only minor importance in the eventual growth of the orange industry in the county. In 1884, the Thermolito Citrus Colony was started on 10,000 acres west of Oroville. It was irrigated by water from the Miocene Canal, a mining ditch dating back to 1875. Oranges from the Oroville area were the first citrus shipped from California. Rice became an important crop in 1918.

By the 1950s, agriculture had become the county's principal source of income. Oranges, rice, apples, peaches, olives, figs, grapes, almonds, honey, and vegetables from truck farms were the primary products. The earliest residents of the foothill ridges had their vegetable gardens and a few pear, peach, and apple trees. These fruits were not grown for sale, however, until the 1880s. Eventually, hundreds of acres were devoted to raising them, especially apples. By the late 1960s, the apple business was in decline because of changing markets and the rapid growth of year-round sources in Washington and Oregon.

The late 1890s saw the beginning of hydroelectric power generation with the formation of several local power and light companies. By 1900, several powerhouses on local creeks were supplying power to Butte County residents and to such distant cities as San Francisco. In 1905, the Pacific Gas & Electric Company was formed with the Butte County system, which then served much of central California. The Butte County system became a major part of the new company. In 1908, Great Western Power built the Big Bend powerhouse, which was a foundation for a system of hydroelectric power plants on the North Fork of the Feather River. It eventually became part of the Pacific Gas & Electric Company. The last project of any significance was construction of the Oroville Dam, which, at 770 feet, is the highest earthen dam in the United States. Construction was completed in 1967. Hydroelectric power generation really was of secondary importance, as the 3.5 million acre feet of water impounded in Lake Oroville were critical to the State Water Project, which supplied areas as far away as southern California.

In 1908, the county led California in gold production. By 1900, however, the lumber industry was rapidly becoming more important. During the Gold Rush, numerous small sawmills cut so much lumber for mining and for building the numerous camps and small towns that the surrounding hills were denuded of trees. As early as 1860, 13 sawmills produced more than 14 million board feet of pine lumber. Numerous companies supplied lumber in the 1870s, 1880s, and 1890s. In 1901, the eastern-based Diamond Match Company bought 69,000 acres of prime timber land (later increased to 300,000 acres) in Butte, Plumas, and Tehama Counties. In 1902, it built a sawmill and a company town named Stirling City. By 1906, it had built the Butte County Railroad, which connected the mill with the company's match factory in Chico. By the time it ceased logging operations in 1958, the sawmill had produced 1,809,000,000 board feet of lumber. The other large lumber producer, the Swayne Lumber Company, was located in the Feather Falls area.

Climate

Prepared by the National Water and Climate Center, Natural Resources Conservation Service, Portland, Oregon.

Table 1 gives data on temperature and precipitation for the survey area as recorded at Oroville (elevation of 170 feet), the Chico Experiment Station (elevation of 190 feet), Paradise (elevation of 1,750 feet), De Sabla (elevation of 2,710 feet), and Strawberry Valley (elevation of 3,810 feet) for the period 1971 to 2000. The Strawberry Valley station is located just outside the survey area, in Yuba County. Table 2 shows probable dates of the first freeze in fall and the last freeze in spring. Table 3 provides data on the length of the growing season.

During winter at elevations below 1,500 feet, the average temperature is 46.5 degrees F and the average daily minimum temperature is 36.2 degrees. The lowest temperature on record, which occurred at the Chico Experiment Station on December 11, 1932, is 11 degrees. In summer, the average temperature is 75.4 degrees and the average daily maximum temperature is 91.9 degrees. The highest temperature, which occurred at the Chico Experiment Station on July 15, 1972, is 117 degrees.

During winter at elevations above 1,500 feet, the average temperature is 39.8 degrees F and the average daily minimum temperature is 29.8 degrees. The lowest temperature on record, which occurred at Strawberry Valley on December 21, 1990, is 4 degrees. In summer, the average temperature is 64.8 degrees and the average daily maximum temperature is 80.4 degrees. The highest temperature, which occurred at Strawberry Valley on September 4, 1955, is 103 degrees.

Growing degree days are shown in table 1. They are equivalent to "heat units." During the month, growing degree days accumulate by the amount that the average temperature each day exceeds a base temperature (50 degrees F). The normal monthly accumulation is used to schedule single or successive plantings of a crop between the last freeze in spring and the first freeze in fall.

At elevations below 1,500 feet, the average annual precipitation is 25.69 inches, as represented by the Chico Experiment Station gauge. Of this, about 12.42 inches, or 48 percent, usually falls in the period March through November. The growing season for most crops falls within this period. The heaviest 1-day rainfall on record is 5.73 inches. It occurred at the Chico Experiment Station on January 3, 1916. Thunderstorms occur on about 4.7 days each year, and most occur in March.

At elevations above 1,500 feet, the representative average annual total precipitation is more than 50 inches. The highest annual total, at Strawberry Valley, is 80.98 inches. Of the 80.98 inches, about 10.98 inches, or nearly 14 percent, usually falls in the period May through October and is very representative of the precipitation at elevations above 1,500 feet. The growing season for most crops falls within this period. The heaviest 1-day rainfall on record is 1.75 inches. It occurred at Strawberry Valley on January 31, 1963.

The seasonal snowfall ranges from 0.2 inch at the Chico Experiment Station (elevation of 190 feet) to 96.6 inches at Strawberry Valley (elevation 3,810 of feet). Paradise represents a transition between the low and high elevations in the survey area. It has an average annual snowfall of about 2.8 inches. The maximum snowfall at Paradise, 17.5 inches, occurred on January 29, 1975. The greatest snow depth at any one time on record is 100 inches. It occurred on January 17, 1952, at Strawberry Valley. On the average at Strawberry Valley, 50 days per year have at least 1 inch of snow on the ground. The heaviest 1-day snowfall on record was 39 inches. It occurred on January 30, 1968. Spring snowmelt from the snowpack at the higher elevations in the survey area is very important to irrigation in spring and summer.

The average relative humidity in midafternoon is about 45 percent. Humidity is higher at night, and the average at dawn is about 83 percent. The sun shines 96 percent of the time possible in summer and 48 percent in winter. The prevailing wind is from the south-southwest. Average windspeed is highest, 9.5 miles per hour, in June.

The climate data the sections "General Soil Map Units," "Detailed Soil Map Units," and "Classification of the Soils" are from data and maps prepared by Jim Goodridge, Climatologist, Chico, California. The maps were used exclusively to determine the ranges of precipitation, mean annual air temperature, and frost-free days assigned to detailed map units and to taxonomic units. Figure 2 is a map of mean annual precipitation, figure 3 is a map of mean annual air temperature, and figure 4 is a map of frost-free days.

How This Survey Was Made

This survey was made to provide information about the soils and miscellaneous areas in the survey area. The information includes a description of the soils and miscellaneous areas and their location and a discussion of their suitability, limitations, and management for specified uses. Soil scientists observed the steepness and shape of the slopes, the general pattern of drainage, the kinds of crops and native plants, and the kinds of bedrock. They dug many holes to study the soil profile, which is the

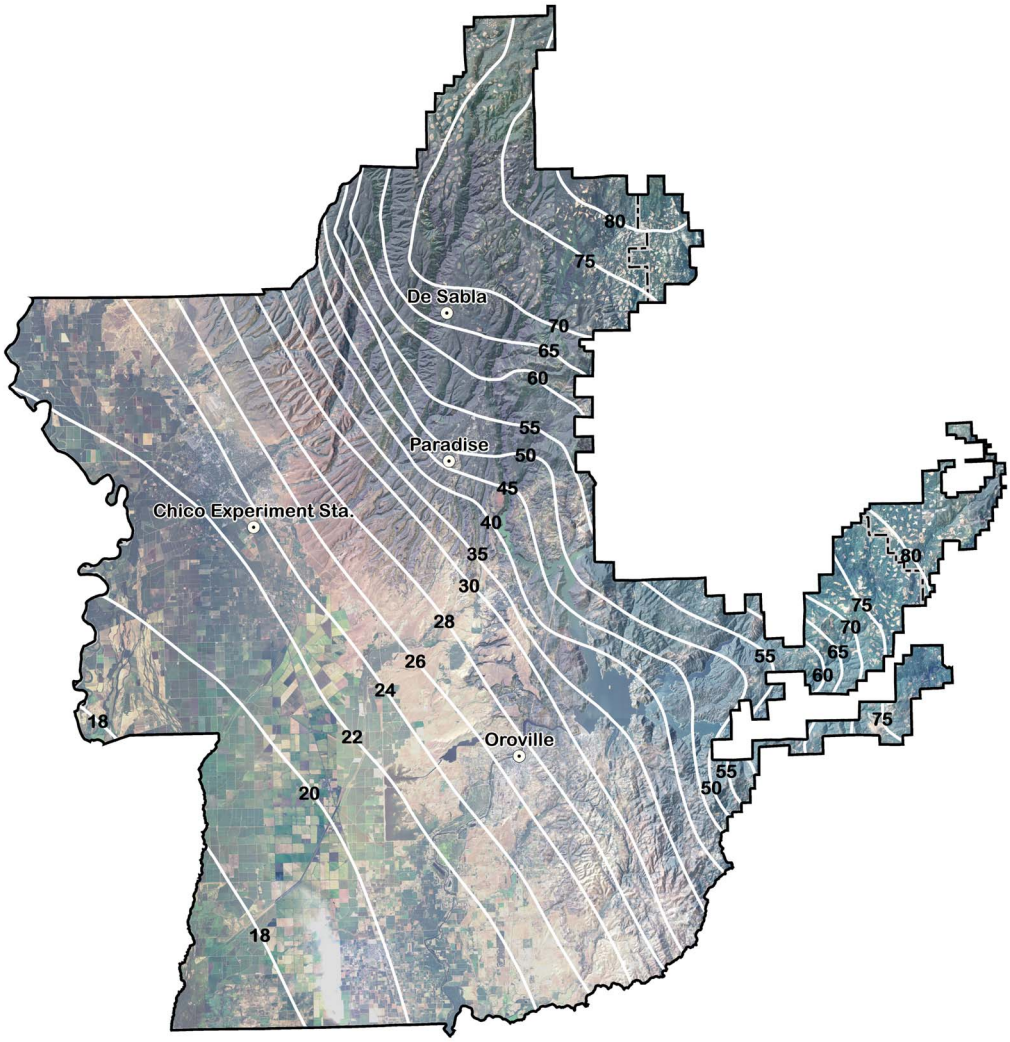

Figure 2.—Mean annual precipitation in inches (based on the 30-year period from 1951 to 1980).

sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil may have formed. The unconsolidated material is devoid of roots and other living organisms and has been minimally changed by other biological activity.

The soils and miscellaneous areas in the survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept or model of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an

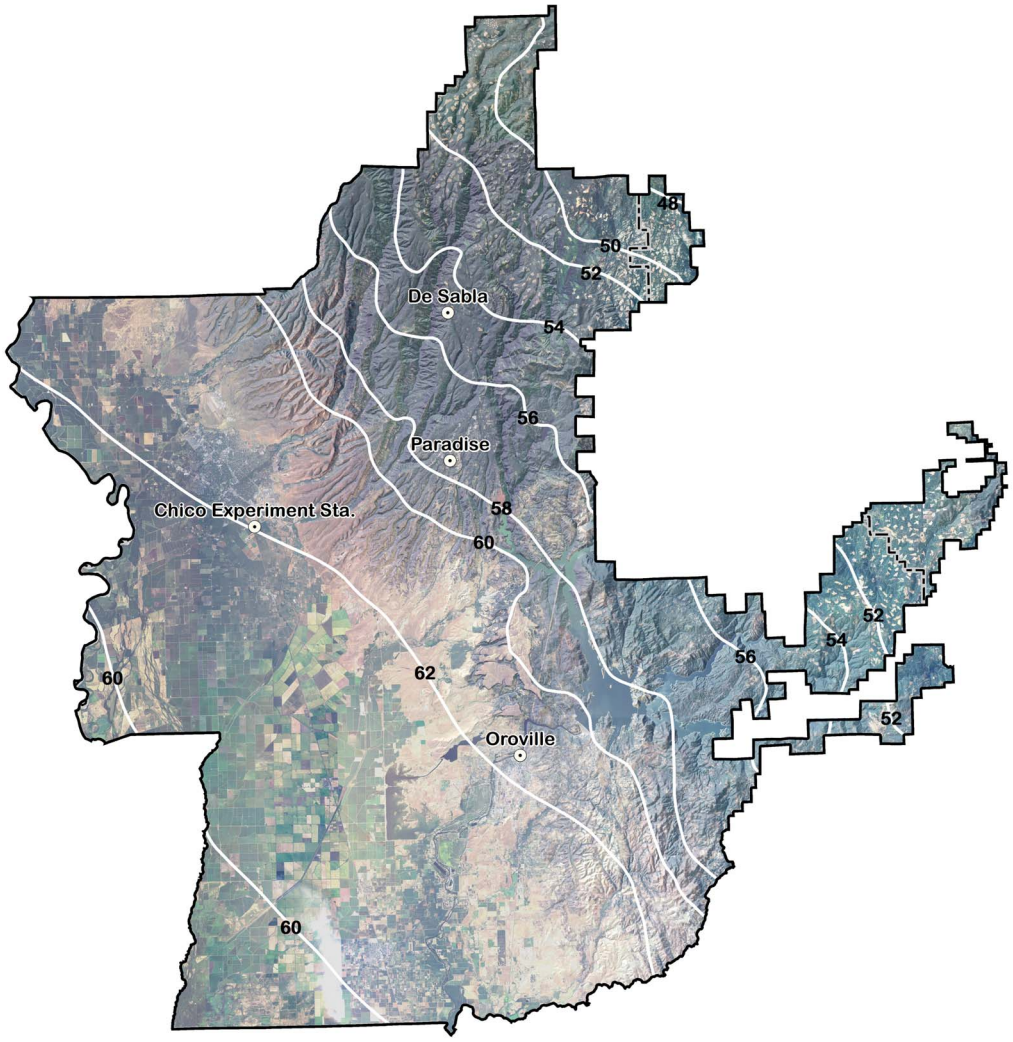

Figure 3.—Mean annual air temperature in degrees F.

understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret

the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

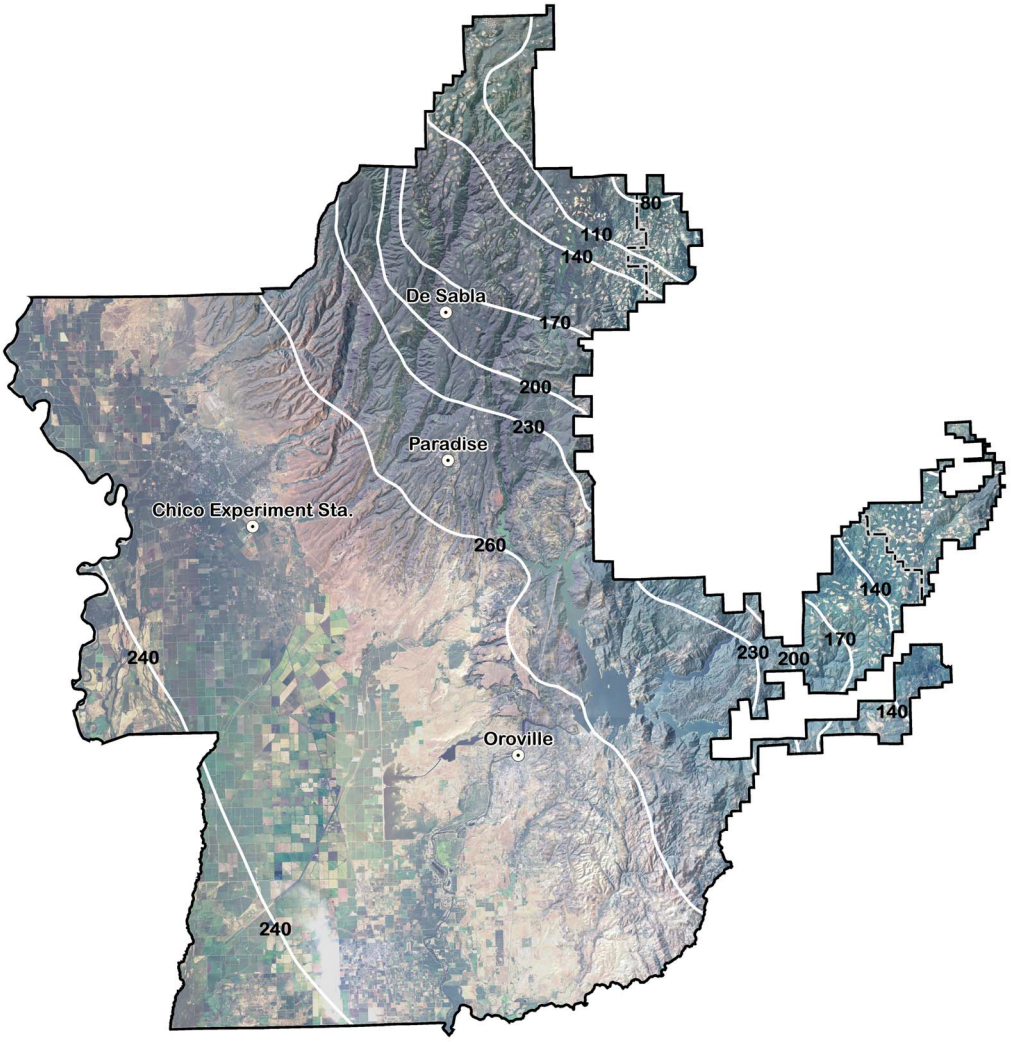

Figure 4.—Frost-free days (above 32 degrees F).

This survey area was mapped at two levels of detail. At the more detailed level, map units are narrowly defined. Map unit boundaries were plotted and verified at closely spaced intervals. At the less detailed level, map units are broadly defined. Boundaries were plotted and verified at wider intervals. The detail of mapping was selected to meet the anticipated long-term use of the survey, and the map units were designed to meet the needs for that use. The soils in the part of the survey area in the Sacramento Valley were mapped at the more detailed level. The soils in the foothills and mountains were mapped at the less detailed level.

The descriptions, names, and delineations of the soils in this survey area do not fully agree with those in the adjacent survey areas. They do not fully agree with those in the surveys of Glenn County, California, and Tehama County, California, mainly because the fieldwork for the adjacent surveys was conducted at a different time. They do not fully agree with those in the resource surveys of the Lassen National Forest and the Plumas National Forest because mapping of these forests was conducted for a different purpose and was completed at a less detailed level. Differences also result from a better knowledge of soils, variations in technical standards and terminology, modifications in series concepts, or variations in the intensity of mapping or in the extent of the soils in the survey areas.

General Soil Map Units

The general soil map in this publication shows broad areas that have a distinctive pattern of soils, relief, and drainage. Each map unit on the general soil map is a unique natural landscape. Typically, it consists of one or more major soils or miscellaneous areas and some minor soils or miscellaneous areas. It is named for the major soils or miscellaneous areas. The components of one map unit can occur in another but in a different pattern.

The general soil map can be used to compare the suitability of large areas for general land uses. Areas of suitable soils can be identified on the map. Likewise, areas where the soils are not suitable can be identified.

Because of its small scale, the map is not suitable for planning the management of a farm or field or for selecting a site for a road or building or other structure. The soils in any one map unit differ from place to place in slope, depth, drainage, and other characteristics that affect management.

Thermic Soils on Flood Plains in the Sacramento Valley

1. Parrott-Gianella-Farwell

Very deep, nearly level, moderately well drained soils that formed in Sacramento River alluvium; on flood plains

Setting

Landscape: Sacramento Valley
Slope range: 0 to 2 percent
Typical vegetation: Walnut and almond orchards, valley oak, Fremont cottonwood, and coyotebrush

Composition

Extent of the map unit: 3.7 percent
Extent of the components in the map unit:
Parrott—34 percent
Gianella—27 percent
Farwell—9 percent
Minor components—30 percent

Soil Properties

Parrott
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Bars on flood plains outside the meander belt
Parent material: Silty alluvium derived from mixed rock sources
Particle-size class: Fine-silty

Soil temperature regime: Thermic
Slope: 0 to 2 percent

Gianella
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Bars on flood plains inside the meander belt
Parent material: Sandy alluvium derived from mixed rock sources
Particle-size class: Coarse-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Farwell
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Outer edge of flood plains
Parent material: Loamy alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Columbia and Columbia taxadjunct soils in channels inside the meander belt on flood plains
- Vermet soils in channels outside the meander belt on flood plains
- Riverwash on gravel bars along the river channel

Use and Management

Major uses: Orchard crops, wildlife habitat, and watershed
Management concerns: Flooding

2. Xerorthents, Tailings-Gianella

Very deep, nearly level to steep, moderately well drained to somewhat excessively drained soils that formed in Feather River and Butte Creek alluvium; on flood plains and stream terraces

Setting

Landscape: Sacramento Valley
Slope range: 0 to 50 percent
Typical vegetation: Valley oak, Fremont cottonwood, sycamore, willow, and walnut orchards

Composition

Extent of the map unit: 2 percent
Extent of the components in the map unit:
Xerorthents, tailings—48 percent
Gianella—35 percent
Minor components—17 percent

Soil Properties

Xerorthents, tailings
Depth class: Very deep
Drainage class: Moderately well drained to somewhat excessively drained
Geomorphic position: Dredger tailings on flood plains and stream terraces

Parent material: Cobbly, gravelly, and sandy alluvium derived from mixed rock sources
Particle-size class: Sandy and sandy-skeletal
Soil temperature regime: Thermic
Slope: 0 to 50 percent

Gianella
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Flood plains
Parent material: Sandy alluvium derived from mixed rock sources
Particle-size class: Coarse-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Urban land in the city of Oroville
- Columbia soils on flood plains
- Riverwash on gravel bars along river and stream channels

Use and Management

Major uses: Wildlife habitat, recreation, orchard crops, and watershed
Management concerns: Flooding and a high content of rock fragments

Thermic Soils in Flood Basins in the Sacramento Valley

3. Lofgren-Blavo

Deep and moderately deep, nearly level, poorly drained soils that formed in alluvium; in flood basins

Setting

Landscape: Sacramento Valley (fig. 5)
Slope range: 0 to 1 percent
Typical vegetation: Rice, *Carex*, spikerush, swampgrass. willow, and cottonwood; valley oak in areas adjacent to Butte Creek

Composition

Extent of the map unit: 4.9 percent
Extent of the components in the map unit:
Lofgren—43 percent
Blavo—39 percent
Minor components—18 percent

Soil Properties

Lofgren
Depth class: Deep
Drainage class: Poorly drained
Geomorphic position: Central flood basins
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Very-fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Figure 5.—A freshly tilled rice field in a flood basin in an area of Lofgren and Blavo soils. This landform is typical of general soil map units 3 through 6. The town of Richvale is in the background.

Blavo
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Central flood basins
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Very-fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Oxyaquic Xerofluvents clay in flood basins
- Clear Lake soils in flood basins

Use and Management

Major uses: Grain crops, hunting, wildlife habitat, and watershed
Management concerns: Flooding, ponding, wetness, and a high content of clay

4. Esquon-Neerdobe

Deep and moderately deep, nearly level, poorly drained soils that formed in alluvium; in flood basins

Setting

Landscape: Sacramento Valley (fig. 5)
Slope range: 0 to 1 percent
Typical vegetation: Rice, Italian ryegrass, curly dock, and spikerush

Composition

Extent of the map unit: 8.6 percent
Extent of the components in the map unit:
Esquon—46 percent
Neerdobe—23 percent
Minor components—31 percent

Soil Properties

Esquon
Depth class: Deep
Drainage class: Poorly drained
Geomorphic position: Outer flood basins
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Neerdobe
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Outer flood basins
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Edjobe soils on basin rims
- Dodgeland and Whitecabin soils in flood basins

Use and Management

Major uses: Grain crops, hunting, wildlife habitat, and watershed
Management concerns: Ponding, wetness, and a high content of clay

5. Bosquejo-Galt

Very deep and moderately deep, nearly level, somewhat poorly drained and poorly drained soils that formed in alluvium; in flood basins

Setting

Landscape: Sacramento Valley (fig. 5)
Slope range: 0 to 1 percent
Typical vegetation: Safflower; wheat; alfalfa; sugar beet, prune, and almond orchards; and annual grasses and forbs

Composition

Extent of the map unit: 1.2 percent
Extent of the components in the map unit:
Bosquejo—74 percent
Galt—11 percent
Minor components—15 percent

Soil Properties

Bosquejo
Depth class: Very deep
Drainage class: Somewhat poorly drained
Geomorphic position: Interfan basins
Parent material: Clayey alluvium derived from volcanic rocks
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Galt
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Interfan basins over low terrace remnants
Parent material: Clayey alluvium over cemented alluvium derived from volcanic rocks
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Bosquejo silt loam, overwash, on margins between flood basins and flood plains

Use and Management

Major uses: Row crops, orchard crops, and watershed
Management concerns: Wetness, ponding, a high content of clay, and depth to a duripan

6. Gridley Taxadjunct-Subaco Taxadjunct

Moderately deep, nearly level, somewhat poorly drained and poorly drained soils that formed in alluvium; on low terraces and in flood basins

Setting

Landscape: Sacramento Valley (fig. 5)
Slope range: 0 to 2 percent
Typical vegetation: Pasture grasses, rice, and willows

Composition

Extent of the map unit: 2.8 percent
Extent of the components in the map unit:
Gridley taxadjunct—52 percent
Subaco taxadjunct—25 percent
Minor components—23 percent

Soil Properties

Gridley taxadjunct
Depth class: Moderately deep
Drainage class: Somewhat poorly drained
Geomorphic position: Low terraces
Parent material: Loamy alluvium over clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine

Soil temperature regime: Thermic
Slope: 0 to 2 percent

Subaco taxadjunct
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Liveoak taxadjunct soils on low fan terraces
- Galt taxadjunct soils on low fan terraces
- Calcic Haploxerolls on knolls on low terraces

Use and Management

Major uses: Irrigated pasture, grain crops, wildlife habitat, homesite development, and watershed
Management concerns: Wetness, ponding, alkalinity, and calcium carbonate content

Thermic Soils on Alluvial Fans in the Sacramento Valley

7. Olashes

Very deep, nearly level, well drained soils that formed in alluvium; on alluvial fans

Setting

Landscape: Sacramento Valley
Slope range: 0 to 2 percent
Typical vegetation: Almond and prune orchards (fig. 6), rice, and beans

Composition

Extent of the map unit: 0.1 percent
Extent of the components in the map unit:
Olashes—85 percent
Minor components—15 percent

Soil Properties

Olashes
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Alluvial fans
Parent material: Loamy alluvium derived from volcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Minor Components

- Oswald soils on basin rims
- Subaco soils in flood basins

Figure 6.—An almond orchard in an area of Almendra soils on an alluvial fan. This landform is typical of general soil map units 7 through 9.

Use and Management

Major uses: Orchard crops, row crops, homesite development, and watershed
Management concerns: Sandy substratum

8. Conejo-Almendra-Vina

Very deep, nearly level, well drained soils that formed in alluvium; on alluvial fans

Setting

Landscape: Sacramento Valley
Slope range: 0 to 1 percent
Typical vegetation: Almond and walnut orchards (fig. 6), valley oak, and annual grasses and forbs

Composition

Extent of the map unit: 5.4 percent
Extent of the components in the map unit:
Conejo—23 percent
Almendra—22 percent
Vina—13 percent
Minor components—42 percent

Soil Properties

Conejo
Depth class: Very deep

Drainage class: Well drained
Geomorphic position: Distal alluvial fans
Parent material: Loamy alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Almendra
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Alluvial fans
Parent material: Loamy alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Vina
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Proximal alluvial fans
Parent material: Sandy alluvium derived from mixed rock sources
Particle-size class: Coarse-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Busacca soils on distal alluvial fans
- Chico soils on low fan terraces
- Charger soils on proximal alluvial fans

Use and Management

Major uses: Orchard crops and urban development
Management concerns: None

9. Haploxerolls-Durixerolls

Deep and moderately deep, nearly level, moderately well drained and somewhat poorly drained soils that formed in alluvium; on alluvial fans

Setting

Landscape: Sacramento Valley
Slope range: 0 to 2 percent
Typical vegetation: Almond and prune orchards (fig. 6), wheat, alfalfa, and safflower

Composition

Extent of the map unit: 1.2 percent
Extent of the components in the map unit:
Haploxerolls—63 percent
Durixerolls—15 percent
Minor components—22 percent

Soil Properties

Haploxerolls
Depth class: Deep
Drainage class: Moderately well drained

Geomorphic position: Alluvial fans
Parent material: Loamy alluvium over cemented alluvium derived from volcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Durixerolls
Depth class: Moderately deep
Drainage class: Somewhat poorly drained
Geomorphic position: Alluvial fans
Parent material: Loamy alluvium over cemented alluvium derived from volcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Minor Components

- Busacca soils on distal alluvial fans
- Almendra soils on alluvial fans
- Galt soils in flood basins

Use and Management

Major uses: Orchard crops, row crops, hay crops, and urban development
Management concerns: Wetness and depth to a duripan

Thermic Soils That Formed in Cascade Alluvium; on Fan Terraces in the Sacramento Valley

10. Redsluff-Redtough-Redswale

Very deep, shallow, and very shallow, nearly level to steep, moderately well drained, somewhat poorly drained, and poorly drained soils that formed in alluvium; on fan terraces (fig. 7)

Setting

Landscape: Sacramento Valley
Slope range: 0 to 35 percent
Typical vegetation: Annual grasses and forbs

Composition

Extent of the map unit: 2.8 percent
Extent of the components in the map unit:
Redsluff—21 percent
Redtough—19 percent
Redswale—10 percent
Minor components—50 percent

Soil Properties

Redsluff
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Low fan terraces
Parent material: Loamy alluvium over gravelly alluvium derived from mixed rock sources

Figure 7.—Mound and swale topography on a terrace in an area of general soil map unit 10. The soils are underlain by a duripan. Livestock grazing is the main use of this unit.

Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Redtough
Depth class: Shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Mounds on high fan terraces
Parent material: Loamy alluvium over cemented, gravelly alluvium derived from volcanic rocks
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 0 to 35 percent

Redswale
Depth class: Very shallow
Drainage class: Poorly drained
Geomorphic position: Swales on high fan terraces
Parent material: Loamy alluvium over cemented, gravelly alluvium derived from volcanic rocks
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Minor Components

- Wafap soils on low stream terraces
- Munjar soils on intermediate fan terraces
- Anita soils in swales and on flats on fan terraces

Use and Management

Major uses: Livestock grazing, urban development, wildlife habitat, and watershed
Management concerns: Wetness and depth to a duripan

Thermic Soils on Feather River Terraces in the Sacramento Valley

11. Liveoak-Boga-Loemstone

Very deep and deep, nearly level, moderately well drained soils that formed in Feather River alluvium; on terraces

Setting

Landscape: Sacramento Valley
Slope range: 0 to 2 percent
Typical vegetation: Walnut, prune, kiwi, peach, and nectarine orchards; valley oak; and annual grasses and forbs

Composition

Extent of the map unit: 1.6 percent
Extent of the components in the map unit:
Liveoak—32 percent
Boga—28 percent
Loemstone—25 percent
Minor components—15 percent

Soil Properties

Liveoak
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Distributary channels on Feather River terraces
Parent material: Loamy alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Boga
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: Feather River terraces
Parent material: Loamy alluvium over dense, silty alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Loemstone
Depth class: Deep
Drainage class: Moderately well drained
Geomorphic position: Feather River terraces
Parent material: Loamy alluvium over dense, silty alluvium derived from mixed rock sources
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Minor Components

- Gridley taxadjunct soils on low terraces
- Tisdale and Marcum soils on terraces

Use and Management

Major uses: Orchard crops and urban development
Management concerns: Wetness and a dense substratum

Thermic Soils That Formed in Sierra Nevada Alluvium; on Low Fan Terraces in the Sacramento Valley

12. Eastbiggs-Duric Xerarents-Kimball

Moderately deep, shallow, and very deep, nearly level, somewhat poorly drained and well drained soils that formed in alluvium; on low terraces

Setting

Landscape: Sacramento Valley
Slope range: 0 to 3 percent
Typical vegetation: Annual grasses and forbs, rice, prune orchards, and valley oak

Composition

Extent of the map unit: 3 percent
Extent of the components in the map unit:
Eastbiggs—38 percent
Duric Xerarents—14 percent
Kimball—11 percent
Minor components—37 percent

Soil Properties

Eastbiggs
Depth class: Moderately deep
Drainage class: Somewhat poorly drained
Geomorphic position: Mounds on low terraces
Parent material: Loamy alluvium over clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 3 percent

Duric Xerarents
Depth class: Shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Leveled low terraces
Parent material: Clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 1 percent

Kimball
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Low terraces
Parent material: Loamy alluvium over clayey alluvium over loamy alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 1 to 3 percent

Minor Components

- Galt soils in basins and swales on low terraces
- Wilsoncreek soils on bars on low stream terraces
- Trainer soils in channels on low stream terraces

Use and Management

Major uses: Livestock grazing, grain crops, orchard crops, wildlife habitat, and watershed
Management concerns: Wetness and depth to a duripan

Thermic Soils That Formed in Sierra Nevada Alluvium; on Intermediate and High Fan Terraces in the Sacramento Valley

13. Thompsonflat-Oroville-Vistarobles

Very deep, moderately deep, and shallow, nearly level to moderately steep, moderately well drained and poorly drained soils that formed in alluvium; on intermediate and high fan terraces

Setting

Landscape: Sacramento Valley
Slope range: 0 to 30 percent
Typical vegetation: Annual grasses and forbs, blue oak, interior live oak, buckbrush, toyon, and whiteleaf manzanita

Composition

Extent of the map unit: 4 percent
Extent of the components in the map unit:
Thompsonflat—28 percent
Oroville—18 percent
Vistarobles—10 percent
Minor components—44 percent

Soil Properties

Thompsonflat
Depth class: Very deep
Drainage class: Moderately well drained
Geomorphic position: High fan terraces
Parent material: Loamy alluvium over clayey alluvium over gravelly alluvium derived from mixed rock sources
Particle-size class: Fine-loamy

Soil temperature regime: Thermic
Slope: 0 to 30 percent

Oroville
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Swales on intermediate fan terraces
Parent material: Loamy alluvium over clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 9 percent

Vistarobles
Depth class: Shallow
Drainage class: Poorly drained
Geomorphic position: Swales on intermediate fan terraces
Parent material: Loamy alluvium over clayey alluvium over cemented alluvium derived from mixed rock sources
Particle-size class: Clayey
Soil temperature regime: Thermic
Slope: 0 to 9 percent

Minor Components

- Redding and Thermalito soils on mounds on intermediate fan terraces
- Fernandez soils on intermediate fan terraces

Use and Management

Major uses: Livestock grazing, urban development, wildlife habitat, and watershed
Management concerns: Wetness and depth to a duripan

Thermic Soils on Lovejoy Basalt and Ione Sediments on Sierra Nevada Foothills

14. Palexerults-Rock Outcrop, Basalt-Coalcanyon

Exposed bedrock and very deep, nearly level to very steep, well drained soils that formed in colluvium and residuum; on foothills

Setting

Landscape: Sierra Nevada foothills (fig. 8)
Slope range: 2 to 50 percent
Typical vegetation: Annual grasses and forbs, lichens, interior live oak, blue oak, and valley oak

Composition

Extent of the map unit: 1.8 percent
Extent of the components in the map unit:
Palexerults—18 percent
Rock outcrop—15 percent
Coalcanyon—15 percent
Minor components—52 percent

Figure 8.—Typical landscape and vegetation in an area of general soil map unit 14. Pictured is Fern Falls on Table Mountain.

Soil Properties

Palexerults
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on foothills
Parent material: Loamy colluvium derived from volcanic rocks over clayey residuum derived from Ione Formation claystone
Particle-size class: Fine-loamy and fine
Soil temperature regime: Thermic
Slope: 2 to 50 percent

Rock outcrop
Geomorphic position: Tops and cliffs on basalt plateaus
Kind of rock: Lovejoy basalt
Slope: 2 to 200 percent

Coalcanyon
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Side slopes on basalt plateaus
Parent material: Gravelly colluvium derived from Lovejoy basalt
Particle-size class: Loamy-skeletal

Soil temperature regime: Thermic
Slope: 5 to 50 percent

Minor Components

- Thermalrocks soils on tops of basalt plateaus
- Coonhollow soils on side slopes of basalt plateaus
- Campbellhills soils in fractures on tops of basalt plateaus

Use and Management

Major uses: Livestock grazing, wildlife habitat, and watershed
Management concerns: Soil slumping, depth to bedrock, and content of rock fragments

Thermic Soils on Strath Terraces on Volcanic Cascade Foothills

15. Tuscan-Clearhayes-Typic Xerofluvents

Shallow, deep, and very deep, nearly level, somewhat poorly drained and well drained soils that formed in alluvium; on strath terraces (fig. 9)

Setting

Landscape: Cascade foothills
Slope range: 0 to 2 percent
Typical vegetation: Annual grasses and forbs, cottonwood, sycamore, black walnut, and valley oak

Composition

Extent of the map unit: 2.7 percent
Extent of the components in the map unit:
Tuscan—9 percent
Clearhayes—8 percent
Typic Xerofluvents—7 percent
Minor components—76 percent

Soil Properties

Tuscan
Depth class: Shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Mounds on high strath terraces on volcanic foothills
Parent material: Loamy alluvium over clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Particle-size class: Clayey
Soil temperature regime: Thermic
Slope: 0 to 3 percent

Clearhayes
Depth class: Deep
Drainage class: Somewhat poorly drained

Figure 9.—Typical landscape and vegetation in an area of general soil map unit 15.

Geomorphic position: Bars on low strath terraces on volcanic foothills
Parent material: Loamy overbank deposits over gravelly channel deposits derived from volcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Typic Xerofluvents
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Stream terraces on volcanic foothills
Parent material: Sandy alluvium derived from hydraulic mine deposition
Particle-size class: Coarse-loamy and sandy-skeletal
Soil temperature regime: Thermic
Slope: 0 to 2 percent

Minor Components

- Wickscorner soils on fan terraces below Table Mountain
- Fallager soils in swales on high strath terraces
- Duric Xerarents on leveled strath terraces

Use and Management

Major uses: Livestock grazing, wildlife habitat, and watershed
Management concerns: Depth to a duripan, depth to bedrock, and wetness

Thermic Soils on Volcanic Cascade Foothills

16. Lucksev-Butteside-Carhart

Very shallow, shallow, and moderately deep, nearly level to steep, moderately well drained and poorly drained soils that formed in alluvium, residuum, and colluvium; on foothills

Setting

Landscape: Cascade foothills
Slope range: 2 to 35 percent
Typical vegetation: Annual grasses and forbs; blue oak at the higher elevations

Composition

Extent of the map unit: 1.5 percent
Extent of the components in the map unit:
Lucksev—31 percent
Butteside—27 percent
Carhart—21 percent
Minor components—21 percent

Soil Properties

Lucksev
Depth class: Very shallow and shallow
Drainage class: Moderately well drained
Geomorphic position: Ridgetops, side slopes, and strath terraces on volcanic foothills
Parent material: Loamy alluvium over clayey alluvium, residuum, and colluvium derived from volcanic rocks
Particle-size class: Clayey
Soil temperature regime: Thermic
Slope: 2 to 35 percent

Butteside
Depth class: Moderately deep
Drainage class: Moderately well drained
Geomorphic position: Side slopes and strath terraces on volcanic foothills
Parent material: Loamy alluvium over clayey alluvium, residuum, and colluvium derived from volcanic rocks
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 2 to 35 percent

Carhart
Depth class: Moderately deep
Drainage class: Poorly drained
Geomorphic position: Basins and footslopes on volcanic foothills
Parent material: Clayey alluvium derived from volcanic rocks
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 0 to 12 percent

Minor Components

- Anita taxadjunct soils in basins and side slopes on foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Depth to bedrock, wetness, and a high content of clay

17. Doemill-Jokerst

Shallow and very shallow, nearly level to moderately steep, somewhat poorly drained and poorly drained soils that formed in residuum; on foothills

Setting

Landscape: Cascade foothills
Slope range: 0 to 30 percent
Typical vegetation: Annual grasses and forbs and scattered blue oak

Composition

Extent of the map unit: 1.8 percent
Extent of the components in the map unit:
Doemill—44 percent
Jokerst—39 percent
Minor components—17 percent

Soil Properties

Doemill
Depth class: Shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Mounds and planar areas on ridgetops, strath terraces, and side slopes on volcanic foothills
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 0 to 30 percent

Jokerst
Depth class: Very shallow
Drainage class: Poorly drained
Geomorphic position: Swales and planar areas on ridgetops, strath terraces, and side slopes on volcanic foothills
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 0 to 30 percent

Minor Components

- Typic Haploxeralfs on side slopes on foothills
- Carhart taxadjunct soils in basins on strath terraces on foothills

Use and Management

Major uses: Livestock grazing, urban development, wildlife habitat, and watershed
Management concerns: Wetness and depth to bedrock

18. Xerorthents, Shallow-Typic Haploxeralfs-Doemill

Very shallow, shallow, moderately deep, and deep, nearly level to very steep, moderately well drained, well drained, and somewhat poorly drained soils that formed in colluvium, residuum, and alluvium; on foothills

Setting

Landscape: Cascade foothills
Slope range: 2 to 100 percent
Typical vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, and manzanita

Composition

Extent of the map unit: 5 percent
Extent of the components in the map unit:
Xerorthents, shallow—22 percent
Typic Haploxeralfs—15 percent
Doemill—6 percent
Minor components—57 percent

Soil Properties

Xerorthents, shallow
Depth class: Very shallow and shallow
Drainage class: Moderately well drained
Geomorphic position: Side slopes in canyons in volcanic foothills
Parent material: Loamy colluvium, residuum, and alluvium derived from volcanic rocks
Particle-size class: Loamy, clayey, loamy-skeletal, clayey-skeletal
Soil temperature regime: Thermic
Slope: 2 to 50 percent

Typic Haploxeralfs
Depth class: Moderately deep and deep
Drainage class: Well drained
Geomorphic position: Side slopes in canyons in volcanic foothills
Parent material: Loamy colluvium, residuum, and alluvium derived from volcanic rocks
Particle-size class: Fine-loamy, fine, loamy-skeletal, clayey-skeletal
Soil temperature regime: Thermic
Slope: 2 to 50 percent

Doemill
Depth class: Shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Ridgetops on volcanic foothills
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 3 to 15 percent

Minor Components

- Chinacamp soils on side slopes in canyons in foothills
- Jokerst soils on ridgetops on foothills
- Ultic Haploxeralfs, conglomerate, on side slopes in canyons in foothills
- Coridge soils on ridgetops of basalt flows in foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

Thermic Soils on Metamorphic Sierra Nevada Foothills

19. Dunstone-Loafercreek-Argonaut Taxadjunct

Shallow and moderately deep, nearly level to moderately steep, well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills
Slope range: 1 to 30 percent
Typical vegetation: Annual grasses and forbs and blue oak (fig. 10)

Composition

Extent of the map unit: 2.8 percent
Extent of the components in the map unit:
Dunstone—44 percent
Loafercreek—14 percent
Argonaut taxadjunct—11 percent
Minor components—31 percent

Soil Properties

Dunstone
Depth class: Shallow
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 1 to 30 percent

Loafercreek
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 1 to 30 percent

Argonaut taxadjunct
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Clayey residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine
Soil temperature regime: Thermic
Slope: 2 to 30 percent

Figure 10.—Blue oak and annual grasses in an area of general soil map unit 19. The landscape is typical of the low Sierra Nevada foothills.

Minor Components

- Katskillhill and Sunnyslope soils on ridgetops and side slopes on foothills
- Rock outcrop on ridgetops and side slopes on foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Depth to bedrock

20. Dunstone-Loafercreek-Oroshore

Shallow and moderately deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills
Slope range: 2 to 90 percent
Typical vegetation: Annual grasses and forbs, interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, and toyon

Composition

Extent of the map unit: 3.1 percent
Extent of the components in the map unit:
Dunstone—29 percent
Loafercreek—19 percent
Oroshore—13 percent
Minor components—39 percent

Soil Properties

Dunstone
Depth class: Shallow
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic and metasedimentary rocks
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 2 to 90 percent

Loafercreek
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 2 to 90 percent

Oroshore
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metasedimentary rocks
Particle-size class: Loamy-skeletal
Soil temperature regime: Thermic
Slope: 3 to 70 percent

Minor Components

- Mounthope soils on ridgetops and side slopes on foothills
- Dystroxerepts and Haploxeralfs on very steep canyon backslopes in foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

21. Mounthope-Hartsmill

Very deep and deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills
Slope range: 2 to 90 percent

Typical vegetation: Whiteleaf manzanita, buckbrush, toyon, annual grasses and forbs, interior live oak, Pacific madrone, foothill pine, and scattered ponderosa pine

Composition

Extent of the map unit: 1 percent
Extent of the components in the map unit:
Mounthope—35 percent
Hartsmill—28 percent
Minor components—37 percent

Soil Properties

Mounthope
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 2 to 90 percent

Hartsmill
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Loamy-skeletal
Soil temperature regime: Thermic
Slope: 2 to 90 percent

Minor Components

- Dunstone and Sommeyflat soils on ridgetops and side slopes on foothills

Use and Management

Major uses: Homesite development, watershed, and wildlife habitat
Management concerns: Slope

22. Ultic Haploxeralfs, Thermic, High Terrace

Moderately deep and deep, nearly level to moderately steep, moderately well drained soils that formed in alluvium; on high terraces

Setting

Landscape: Sierra Nevada foothills
Slope range: 2 to 30 percent
Typical vegetation: Annual grasses and forbs, blue oak, foothill pine, and whiteleaf manzanita

Composition

Extent of the map unit: 0.5 percent
Extent of the components in the map unit:
Ultic Haploxeralfs, thermic, high terrace—95 percent
Minor components—5 percent

Soil Properties

Ultic Haploxeralfs, thermic, high terrace
Depth class: Moderately deep and deep
Drainage class: Moderately well drained
Geomorphic position: High terraces
Parent material: Loamy alluvium over gravelly alluvium derived from mixed sources
Particle-size class: Fine-loamy and loamy-skeletal
Soil temperature regime: Thermic
Slope: 2 to 30 percent

Minor Components

- Dunstone and Loafercreek soils on ridgetops and side slopes on foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Wetness, rock fragments, and slope

Thermic Soils on Plutons on Sierra Nevada Foothills

23. Flanly-Swedesflat-Parkshill

Moderately deep, shallow, and very deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills (fig. 11)
Slope range: 2 to 50 percent
Typical vegetation: Annual grasses and forbs, interior live oak, blue oak, foothill pine, and buckbrush

Composition

Extent of the map unit: 2.3 percent
Extent of the components in the map unit:
Flanly—36 percent
Swedesflat—19 percent
Parkshill—12 percent
Minor components—33 percent

Soil Properties

Flanly
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Loamy residuum and colluvium derived from quartz diorite
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 2 to 50 percent

Swedesflat
Depth class: Shallow

Figure 11.—A typical area on plutons in the Sierra Nevada foothills. This landscape is typical of general soil map units 23 and 24. Stringtown Mountain and Lake Oroville are in the background.

Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Loamy residuum and colluvium derived from quartz diorite
Particle-size class: Loamy
Soil temperature regime: Thermic
Slope: 2 to 30 percent

Parkshill
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Sandy residuum and colluvium derived from quartz diorite or gabbro
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 2 to 15 percent

Minor Components

- Rackerby soils on side slopes on foothills
- Hurleton and Sommeyflat soils on ridgetops on foothills

Use and Management

Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

24. Crystalhill-Oregongulch-Craigsaddle

Very deep, moderately deep, and deep, nearly level to very steep, somewhat excessively drained and well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills (fig. 11)
Slope range: 2 to 70 percent
Typical vegetation: Whiteleaf manzanita, toyon, annual grasses and forbs, interior live oak, canyon live oak, Pacific madrone, foothill pine, and scattered ponderosa pine

Composition

Extent of the map unit: 2.4 percent
Extent of the components in the map unit:
Crystalhill—24 percent
Oregongulch—14 percent
Craigsaddle—14 percent
Minor components—48 percent

Soil Properties

Crystalhill
Depth class: Very deep
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Sandy residuum and colluvium derived from intrusive igneous rocks
Particle-size class: Coarse-loamy
Soil temperature regime: Thermic
Slope: 2 to 70 percent

Oregongulch
Depth class: Moderately deep
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Sandy residuum and colluvium derived from intrusive igneous rocks
Particle-size class: Coarse-loamy
Soil temperature regime: Thermic
Slope: 2 to 70 percent

Craigsaddle
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in foothills
Parent material: Loamy residuum and colluvium derived from intrusive igneous rocks
Particle-size class: Fine-loamy
Soil temperature regime: Thermic
Slope: 2 to 70 percent

Minor Components

- Sommeyflat, Mounthope, and Forbestown soils on side slopes on foothills

Use and Management

Major uses: Wildlife habitat, watershed, and homesite development
Management concerns: Depth to bedrock, slope, and erodibility

Mesic Soils on Volcanic Cascade Foothills

25. Rockstripe-Ultic Haploxeralfs, Mesic-Ultic Haploxeralfs

Very shallow, moderately deep, and deep, nearly level to very steep, somewhat poorly drained and well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Cascade foothills
Slope range: 2 to 100 percent
Typical vegetation: Buckbrush, scrub oak, manzanita, annual grasses and forbs, interior live oak, canyon live oak, California black oak, and foothill pine

Composition

Extent of the map unit: 3.7 percent
Extent of the components in the map unit:
Rockstripe—33 percent
Ultic Haploxeralfs, mesic—25 percent
Ultic Haploxeralfs—22 percent
Minor components—20 percent

Soil Properties

Rockstripe
Depth class: Very shallow
Drainage class: Somewhat poorly drained
Geomorphic position: Ridgetops and side slopes in canyons in volcanic foothills
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Loamy-skeletal
Soil temperature regime: Mesic
Slope: 2 to 100 percent

Ultic Haploxeralfs, mesic
Depth class: Moderately deep and deep
Drainage class: Well drained
Geomorphic position: Ridgetops and shoulder slopes on volcanic foothills
Parent material: Loamy residuum derived from volcanic rocks
Particle-size class: Fine-loamy, fine, loamy-skeletal, clayey-skeletal
Soil temperature regime: Mesic
Slope: 2 to 30 percent

Ultic Haploxeralfs
Depth class: Moderately deep and deep
Drainage class: Well drained
Geomorphic position: Side slopes in canyons in volcanic foothills
Parent material: Loamy colluvium derived from volcanic rocks
Particle-size class: Fine-loamy and loamy-skeletal
Soil temperature regime: Mesic
Slope: 30 to 100 percent

Minor Components

- Rock outcrop, cliffs, on canyon backslopes in foothills

Use and Management

Major uses: Homesite development, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

Mesic Soils on Metamorphic Sierra Nevada Foothills

26. Bigridge-Minniecreek

Deep and moderately deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on foothills

Setting

Landscape: Sierra Nevada foothills
Slope range: 2 to 70 percent
Typical vegetation: Whiteleaf manzanita, toyon, interior live oak, Pacific madrone, canyon live oak, foothill pine, ponderosa pine, and poison oak

Composition

Extent of the map unit: 0.3 percent
Extent of the components in the map unit:
Bigridge—50 percent
Minniecreek—35 percent
Minor components—15 percent

Soil Properties

Bigridge
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 2 to 70 percent

Minniecreek
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic foothills
Parent material: Loamy residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 2 to 70 percent

Minor Components

- Mounthope soils, Hartsmill soils, and Rock outcrop on ridgetops and side slopes on foothills

Use and Management

Major uses: Homesite development, wildlife habitat, watershed, and limited timber production
Management concerns: Slope and depth to bedrock

Mesic Soils on Volcanic Cascade Mountains

27. Paradiso-Schott-Tusccoll

Very deep and deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Cascade Mountains
Slope range: 2 to 70 percent
Typical vegetation: Ponderosa pine, Douglas-fir, sugar pine, incense cedar, California black oak, deerbrush, and whiteleaf manzanita

Composition

Extent of the map unit: 3.9 percent
Extent of the components in the map unit:
Paradiso—50 percent
Schott—20 percent
Tusccoll—9 percent
Minor components—21 percent

Soil Properties

Paradiso
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops on volcanic plateaus
Parent material: Clayey residuum derived from volcanic rocks
Particle-size class: Fine
Soil temperature regime: Mesic
Slope: 2 to 30 percent

Schott
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and canyon side slopes on volcanic plateaus
Parent material: Loamy residuum and colluvium derived from volcanic mudflow breccia
Particle-size class: Loamy-skeletal
Soil temperature regime: Mesic
Slope: 3 to 50 percent

Tusccoll
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Backslopes in canyons in volcanic plateaus
Parent material: Loamy colluvium derived from volcanic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 30 to 70 percent

Minor Components

- Rock outcrop on ridgetops and side slopes on volcanic plateaus
- Mountyana soils on ridgetops on volcanic plateaus
- Lydon soils on ridgetops and side slopes on volcanic plateaus

Use and Management

Major uses: Homesite development, timber production, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

28. Mountyana-Beecee-Lydon

Very deep and moderately deep, nearly level to very steep, well drained and somewhat excessively drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Cascade Mountains (fig. 12)
Slope range: 2 to 100 percent
Typical vegetation: Ponderosa pine, Douglas-fir, sugar pine, white fir, incense cedar, California black oak, tanoak, deerbrush, canyon live oak, and Pacific poison oak

Composition

Extent of the map unit: 2.6 percent
Extent of the components in the map unit:
Mountyana—36 percent
Beecee—28 percent

Figure 12.—Big Chico Creek Canyon in an area of general soil map unit 28. The landscape and vegetation are characteristic of areas in the Cascade Mountains. The Sierra Nevada Mountains are in the background.

Lydon—12 percent
Minor components—24 percent

Soil Properties

Mountyana
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops on volcanic plateaus
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 2 to 30 percent

Beecee
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Backslopes in canyons in volcanic plateaus
Parent material: Loamy colluvium derived from volcanic rocks
Particle-size class: Medial-skeletal
Soil temperature regime: Mesic
Slope: 30 to 70 percent

Lydon
Depth class: Moderately deep
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on volcanic plateaus
Parent material: Sandy residuum and colluvium derived from volcanic mudflow breccia
Particle-size class: Loamy-skeletal
Soil temperature regime: Mesic
Slope: 2 to 100 percent

Minor Components

- Rock outcrop on ridgetops and side slopes on volcanic plateaus
- Paradiso soils on ridgetops on volcanic plateaus
- Schott soils on ridgetops and side slopes on volcanic plateaus

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

29. Redbone

Deep, nearly level to moderately steep, well drained soils that formed in residuum; on mountains

Setting

Landscape: Cascade Mountains (fig. 13)
Slope range: 3 to 30 percent
Typical vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, incense cedar, Sierra chinquapin, and greenleaf manzanita

Figure 13.—A road-cut exposure of Redbone soils.

Composition

Extent of the map unit: 0.6 percent
Extent of the components in the map unit:
Redbone—71 percent
Minor components—29 percent

Soil Properties

Redbone
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops on volcanic plateaus
Parent material: Loamy residuum derived from volcanic mudflow breccia
Particle-size class: Medial over loamy-skeletal
Soil temperature regime: Mesic
Slope: 3 to 30 percent

Minor Components

- Lydon and Mountyana soils on ridgetops on volcanic plateaus
- Endoaquolls in meadows in mountain valleys

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Depth to bedrock

Mesic Soils on Metamorphic Sierra Nevada Mountains

30. Surnuf-Griffgulch-Typic Haploxeralfs, Magnesic

Very deep, deep, and moderately deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 3 to 80 percent
Typical vegetation: Ponderosa pine, Douglas-fir (fig. 14), foothill pine, California black oak, canyon live oak, tanoak, whiteleaf manzanita, toyon, and poison oak

Composition

Extent of the map unit: 3.5 percent
Extent of the components in the map unit:
Surnuf—25 percent
Griffgulch—10 percent
Typic Haploxeralfs, magnesic—8 percent
Minor components—57 percent

Figure 14.—This view of the metamorphic mountain landscape is representative of general soil map unit 30. The vegetation is dominated by ponderosa pine and Douglas-fir.

Soil Properties

Surnuf
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey residuum and colluvium derived from metavolcanic rocks
Particle-size class: Fine
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Griffgulch
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey residuum and colluvium derived from metavolcanic rocks
Particle-size class: Clayey-skeletal
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Typic Haploxeralfs, magnesic
Depth class: Moderately deep to very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey residuum and colluvium derived from serpentinite
Particle-size class: Clayey-skeletal
Soil temperature regime: Mesic
Slope: 3 to 80 percent

Minor Components

- Bigridge and Millerridge soils on ridgetops and side slopes on mountains
- Surnuf taxadjunct soils on ridgetops and side slopes on mountains

Use and Management

Major uses: Timber production, homesite development, wildlife habitat, and watershed
Management concerns: All three soils—depth to bedrock, surface stones, and slope; Typic Haploxeralfs, magnesic—calcium magnesium imbalance

31. Toadtown-Powellton-Rogerville

Very deep and deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 2 to 70 percent
Typical vegetation: Ponderosa pine, Douglas-fir, sugar pine, incense cedar, white fir, California black oak, tanoak, Pacific madrone, Pacific dogwood, and deerbrush

Composition

Extent of the map unit: 4.3 percent
Extent of the components in the map unit:
Toadtown—27 percent
Powellton—15 percent

Rogerville—8 percent
Minor components—50 percent

Soil Properties

Toadtown
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey residuum and colluvium derived from metamorphic rocks
Particle-size class: Fine
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Powellton
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Loamy residuum and colluvium derived from metamorphic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Rogerville
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey residuum and colluvium derived from ultramafic rocks
Particle-size class: Fine
Soil temperature regime: Mesic
Slope: 2 to 70 percent

Minor Components

- Dixmine and Hietanen soils on ridgetops and side slopes on mountains
- Sites taxadjunct soils on ridgetops and side slopes on mountains

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope

32. Obstruction-Obskel-Bottlehill

Very deep, deep, and moderately deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 3 to 110 percent
Typical vegetation: White fir, ponderosa pine, Douglas-fir, sugar pine, California black oak, Pacific dogwood, whitethorn ceanothus, and greenleaf manzanita

Composition

Extent of the map unit: 2.7 percent
Extent of the components in the map unit:
Obstruction—22 percent
Obskel—19 percent

Bottlehill—16 percent
Minor components—43 percent

Soil Properties

Obstruction
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Loamy residuum and colluvium derived from coarse grained metamorphic rocks
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Obskel
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Sandy residuum and colluvium derived from coarse grained metamorphic rocks
Particle-size class: Loamy-skeletal
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Bottlehill
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Loamy residuum and colluvium derived from metavolcanic and metasedimentary rocks
Particle-size class: Loamy-skeletal
Soil temperature regime: Mesic
Slope: 3 to 110 percent

Minor Components

- Logtrain and Walkermine soils on ridgetops and side slopes on mountains
- Retsongulch soils on canyon side slopes in mountains

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

Mesic Soils on Plutons in the Sierra Nevada Mountains

33. Islandbar-Featherfalls-Chawanakee

Very deep and shallow, nearly level to very steep, somewhat excessively drained and well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 2 to 70 percent
Typical vegetation: Ponderosa pine, incense cedar, Douglas-fir, canyon live oak,

tanoak, Pacific madrone, whiteleaf manzanita, deerbrush, California honeysuckle, and poison oak

Composition

Extent of the map unit: 2 percent
Extent of the components in the map unit:
Islandbar—40 percent
Featherfalls—34 percent
Chawanakee—10 percent
Minor components—16 percent

Soil Properties

Islandbar
Depth class: Very deep
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Sandy residuum and colluvium derived from quartz diorite
Particle-size class: Coarse-loamy
Soil temperature regime: Mesic
Slope: 2 to 70 percent

Featherfalls
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Loamy residuum and colluvium derived from quartz diorite
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 2 to 70 percent

Chawanakee
Depth class: Shallow
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Sandy residuum and colluvium derived from quartz diorite
Particle-size class: Loamy
Soil temperature regime: Mesic
Slope: 3 to 70 percent

Minor Components

- Rock outcrop and Lithic Xerorthents on ridgetops and side slopes on mountains
- Fluvaquents, loamy, on stream terraces in mountain valleys

Use and Management

Major uses: Timber production, homesite development, wildlife habitat, and watershed
Management concerns: Depth to bedrock, slope, and erodibility

34. Bonneyridge-Chawanakee-Lewisflat

Very deep and shallow, nearly level to very steep, somewhat excessively drained and well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains (fig. 15)
Slope range: 2 to 110 percent

Figure 15.—Sierra Nevada (pluton) landscape and vegetation typical of general soil map unit 34. Exposed quartz diorite rock outcrop is in the foreground at left.

Typical vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and greenleaf manzanita

Composition

Extent of the map unit: 3.7 percent
Extent of the components in the map unit:
Bonneyridge—42 percent
Chawanakee—15 percent
Lewisflat—11 percent
Minor components—32 percent

Soil Properties

Bonneyridge
Depth class: Very deep
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Sandy residuum and colluvium derived from quartz diorite
Particle-size class: Coarse-loamy
Soil temperature regime: Mesic
Slope: 2 to 110 percent

Chawanakee
Depth class: Shallow
Drainage class: Somewhat excessively drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Sandy residuum and colluvium derived from quartz diorite
Particle-size class: Loamy
Soil temperature regime: Mesic
Slope: 2 to 110 percent

Lewisflat
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on plutons in mountains
Parent material: Loamy residuum and colluvium derived from quartz diorite
Particle-size class: Fine-loamy
Soil temperature regime: Mesic
Slope: 2 to 50 percent

Minor Components

- Rock outcrop and Billscabin soils on ridgetops and side slopes on mountains

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Depth to bedrock, slope, and erodibility

Mesic Soils on Volcanic Sierra Nevada Mountains

35. Mudwash-Shakeridge-Timberisland

Very deep and deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 0 to 70 percent
Typical vegetation: White fir, incense cedar, ponderosa pine, sugar pine, Douglas-fir, California black oak, deerbrush, whitethorn ceanothus, and greenleaf manzanita

Composition

Extent of the map unit: 0.7 percent
Extent of the components in the map unit:
Mudwash—35 percent
Shakeridge—19 percent
Timberisland—13 percent
Minor components—33 percent

Soil Properties

Mudwash
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on basalt plateaus
Parent material: Tephra over residuum and colluvium derived from Lovejoy basalt
Particle-size class: Medial over loamy
Soil temperature regime: Mesic
Slope: 0 to 50 percent

Shakeridge
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on basalt plateaus
Parent material: Tephra over residuum and colluvium derived from Lovejoy basalt
Particle-size class: Medial-skeletal

Soil temperature regime: Mesic
Slope: 0 to 70 percent

Timberisland
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on basalt plateaus
Parent material: Tephra over residuum and colluvium derived from Lovejoy basalt
Particle-size class: Medial-skeletal
Soil temperature regime: Mesic
Slope: 0 to 30 percent

Minor Components

- Lava flows on tops of basalt plateaus
- Lumpkin and Lavatop soils on ridgetops and side slopes on basalt plateaus

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope

Frigid Soils on Volcanic Cascade Mountains

36. Bonepile

Deep, nearly level to moderately steep, well drained soils that formed in residuum; on mountains

Setting

Landscape: Cascade Mountains
Slope range: 2 to 30 percent
Typical vegetation: White fir, ponderosa pine, sugar pine, Douglas-fir, California black oak, greenleaf manzanita, Sierra chinquapin, and whitethorn ceanothus

Composition

Extent of the map unit: 0.6 percent
Extent of the components in the map unit:
Bonepile—69 percent
Minor components—31 percent

Soil Properties

Bonepile
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops on volcanic plateaus
Parent material: Tephra over residuum derived from volcanic rocks
Particle-size class: Medial-skeletal
Soil temperature regime: Frigid
Slope: 2 to 30 percent

Minor Components

- Bonepile taxadjunct soils on stream terraces in mountain valleys
- Lydon soils on ridgetops on volcanic plateaus

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Stones and boulders on the surface and depth to bedrock

Frigid Soils on Volcanic Sierra Nevada Mountains

37. Powderhouse-McNair-Greenwell

Moderately deep and deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 0 to 50 percent
Typical vegetation: White fir, California red fir, sugar pine, incense cedar, California black oak, Jeffrey pine, greenleaf manzanita, and whitethorn ceanothus

Composition

Extent of the map unit: 0.6 percent
Extent of the components in the map unit:
Powderhouse—43 percent
McNair—23 percent
Greenwell—18 percent
Minor components—16 percent

Soil Properties

Powderhouse
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on volcanic plateaus
Parent material: Tephra, residuum, and colluvium derived from volcanic mudflow
Particle-size class: Medial-skeletal
Soil temperature regime: Frigid
Slope: 0 to 50 percent

McNair
Depth class: Deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on volcanic plateaus
Parent material: Tephra over residuum and colluvium derived from volcanic mudflow
Particle-size class: Medial-skeletal
Soil temperature regime: Frigid
Slope: 2 to 50 percent

Greenwell
Depth class: Moderately deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on volcanic plateaus
Parent material: Tephra over residuum and colluvium derived from volcanic mudflow
Particle-size class: Medial
Soil temperature regime: Frigid
Slope: 2 to 50 percent

Minor Components

- Lumpkin taxadjunct soils on tops of volcanic plateaus
- Rock outcrop on ridgetops and side slopes on volcanic plateaus

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope and depth to bedrock

Frigid Soils on Metamorphic Sierra Nevada Mountains

38. Dejonah-Stagpoint

Very deep, nearly level to very steep, well drained soils that formed in residuum and colluvium; on mountains

Setting

Landscape: Sierra Nevada Mountains
Slope range: 2 to 70 percent
Typical vegetation: White fir, California red fir, sugar pine, incense cedar, whitethorn ceanothus, greenleaf manzanita, and pinemat manzanita

Composition

Extent of the map unit: 0.7 percent
Extent of the components in the map unit:
Dejonah—39 percent
Stagpoint—39 percent
Minor components—22 percent

Soil Properties

Dejonah
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Tephra-influenced residuum and colluvium derived from metavolcanic and metamorphosed intrusive igneous rocks
Particle-size class: Fine-loamy
Soil temperature regime: Frigid
Slope: 2 to 70 percent

Stagpoint
Depth class: Very deep
Drainage class: Well drained
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Tephra-influenced residuum and colluvium derived from metavolcanic and metamorphosed intrusive igneous rocks
Particle-size class: Loamy-skeletal
Soil temperature regime: Frigid
Slope: 2 to 70 percent

Minor Components

- Rogerville taxadjunct soils on side slopes on mountains

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Slope

Frigid Soils on Moraines in the Sierra Nevada and Cascade Mountains

39. Haploxerands, Volcanic Till-Haploxerands, Granitic Till

Moderately deep to very deep, nearly level to very steep, moderately well drained and well drained soils that formed in glacial till; on moraines on mountains

Setting

Landscape: Sierra Nevada and Cascade Mountains
Slope range: 2 to 50 percent
Typical vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, and greenleaf manzanita

Composition

Extent of the map unit: 0.4 percent
Extent of the components in the map unit:
Haploxerands, volcanic till—37 percent
Haploxerands, granitic till—36 percent
Minor components—27 percent

Soil Properties

Haploxerands, volcanic till
Depth class: Moderately deep to very deep
Drainage class: Moderately well drained and well drained
Geomorphic position: Ridgetops and side slopes on glacial moraines
Parent material: Bouldery, loamy glacial till derived from igneous rocks
Particle-size class: Medial and medial-skeletal
Soil temperature regime: Frigid
Slope: 2 to 50 percent

Haploxerands, granitic till
Depth class: Moderately deep to very deep
Drainage class: Moderately well drained and well drained
Geomorphic position: Ridgetops and side slopes on glacial moraines
Parent material: Bouldery, sandy glacial till derived from igneous rocks
Particle-size class: Medial and medial-skeletal
Soil temperature regime: Frigid
Slope: 2 to 50 percent

Minor Components

- Haploxerands on terraces in mountain valleys
- Aquic Xerofluvents in meadows in mountain valleys
- Rock outcrop on ridgetops and side slopes on mountains

Use and Management

Major uses: Timber production, wildlife habitat, and watershed
Management concerns: Depth to dense glacial till, slope, erodibility, and boulders

W—Water

Extent of the map unit: 3.5 percent

Detailed Soil Map Units

The map units delineated on the detailed soil maps in this survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this section, along with the maps, can be used to determine the suitability and potential of a unit for specific uses. They also can be used to plan the management needed for those uses.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. The contrasting components are mentioned in the map unit descriptions. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Some map units from adjacent survey areas have been added to the soil legend for this survey area so that the mapping joins across survey area boundaries. Letters have been added at the end of the map symbols for these map units. The letters “co” refer to Colusa County, the letters “su” refer to Sutter County, and the letters “yu” refer to Yuba County.

Each description includes general facts about the unit and gives the principal hazards and limitations to be considered in planning for specific uses.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Gianella silt loam, 0 to 1 percent slopes, frequently flooded, is a phase of the Gianella series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes. A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Lydon-Rock outcrop complex, 50 to 70 percent slopes, is an example.

This survey includes *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop, Pits, Lava flows, and Riverwash are examples.

Table 4 gives the acreage and proportionate extent of each map unit. Other tables give properties of the soils and the limitations, capabilities, and potentials for many uses. The Glossary defines many of the terms used in describing the soils or miscellaneous areas.

Block Diagrams of Detailed Soil Map Units

Prepared by Andrew Conlin, Soil Scientist, Natural Resources Conservation Service.

Figures 16 to 24 illustrate the relationship of the detailed soil map units in the survey area to the geology, geography, topography, slope phases, and climate in the area. Figure 16 shows the location of block diagrams 1 to 8 (figures 17 to 24). The block diagrams were produced from the detailed soil maps. The vertical scale of the diagrams is exaggerated 2 times in relation to the horizontal scale. This exaggeration helps to more clearly illustrate the topography of the area. The representative geology is not to scale and is idealized to help explain mapping concepts. The block diagrams are not intended to replace the detailed soil maps.

Block diagram 1 (figure 17).—This diagram shows the mouth of Big Chico Creek Canyon, where the creek transitions from its steeper foothill reach to its flatter Sacramento Valley reach in Bidwell Park. The creek has cut through the volcanic Tuscan Formation and is now cutting through hard Lovejoy basalt. The resistant Lovejoy basalt confines the stream channel, and a narrow slot canyon has formed at the bottom of the wider Tuscan Canyon. As the creek leaves the confinement of the slot canyon and enters the flatter topography of the valley, the energy of the water decreases, causing sediment to be deposited. As sediment fills the channel, the channel begins to move laterally. The channel slowly migrates away from the sediment deposits, allowing the sediment to form into alluvial soils.

Block diagram 2 (figure 18).—This diagram shows a portion of the Table Mountain area, the result of stream erosion slowly cutting away basalt flow rock, exposing the underlying Ione Formation. The sediment produced from this downcutting is transported downstream to flatter surrounding areas and over time is deposited and forms alluvial soils on various alluvial landforms.

Block diagram 3 (figure 19).—This diagram shows the interface of the Northern Sierra Nevada and Southern Cascade Mountains. Volcanic flows moved down the canyon of the West Branch of the Feather River, burying Sierra Nevada rocks, and partially filled the canyon, forming a volcanic plain. Subsequent geologic erosion has cut away the original plain of volcanic rocks and has left remnants surrounded by

Figure 24.—Block diagram 8.

steep canyons. The area of alluvium shown near the bottom of the diagram is a bar of sediment deposited in the flatter volcanic reach below the steeper metamorphic reach.

Block diagram 4 (figure 20).—This diagram shows the topographic difference between some of the volcanic Cascade and metamorphic Sierra Nevada landforms. Stream channels cut across the grain of the nearly vertically oriented metamorphic Sierra Nevada rocks. The resistance of the metamorphic rocks deflects the stream from side to side, forming an irregular topography. The volcanic flows traveled horizontally and buried the Sierra Nevada rocks, forming a dissected plateau.

Block diagram 5 (figure 21).—This diagram shows the relationships between the Cascade volcanic flows and the metamorphic and granitic Sierra Nevada rocks. The flatter volcanic flows on the left buried the folded metamorphic rocks in the middle. The uniform intrusive igneous rocks weather to soils that are less resistant to geologic erosion and produce subtle, more evenly developed relief.

Block diagram 6 (figure 22).—This diagram shows the transition from the volcanic foothills to the flatter topography of the strath terraces adjacent to the Sacramento Valley. In the steeper upper reaches, the stream channels are confined on the canyon bottoms and begin to migrate laterally as the gradient decreases. As the stream channels meander with lower energy, they deposit sediment, forming various alluvial soils and landforms over time.

Block diagram 7 (figure 23).—This diagram shows a series of glacial moraines. Early glaciers scoured and partially removed the original volcanic flows and produced glacial till derived mostly from volcanic rocks. Subsequent glaciers formed on the exposed underlying pluton and produced glacial till derived mostly from intrusive igneous rocks.

Block diagram 8 (figure 24).—This diagram shows the stretch of Butte Creek Canyon where the creek has cut through volcanic flows, exposing underlying marine sedimentary rocks and Sierran metamorphic rocks. The upstream portion of the marine sedimentary rocks is conglomerate, the gravelly and cobbly facies. The downstream portion is sandstone, the sand facies. The conglomerate erodes one clast at a time and forms steep ravines. The sandstone holds water and often gives way in landslides and becomes buried by the colluvium from the rocks above.

100—Anita-Galt complex, 0 to 3 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 170 to 340 feet (52 to 104 meters)
Mean annual precipitation: 23 to 27 inches (584 to 686 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Anita clay—60 percent
Galt clay—25 percent
Minor components—15 percent

Characteristics of Anita Clay

Slope: 0 to 3 percent
Geomorphic position: Drainageways and depressions on fan terraces

Parent material: Clayey alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 0 to 25 percent well rounded cobbles, 0 to 2 percent well rounded stones
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 2.2 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6s-5
Land capability, nonirrigated: 6s-5
Storie index: 3 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 1 inch; clay
A2—1 to 3 inches; clay
Bss1—3 to 10 inches; clay
Bss2—10 to 15 inches; clay
2Bkqm—15 to 20 inches; duripan

Characteristics of Galt Clay

Slope: 0 to 3 percent
Geomorphic position: Drainageways and depressions on fan terraces
Parent material: Clayey alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay
A2—3 to 13 inches; clay
Bss—13 to 29 inches; clay
Bkss—29 to 32 inches; clay
2Bkqm—32 to 39 inches; duripan

Minor Components in Map Unit 100

Bosquejo clay and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Drainageways and depressions on fan terraces
Hydric soil status: Hydric

Areas where a duripan or volcanic sediments crop out
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Igo loam and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Tuscan gravelly loam and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Vernal pools on fan terraces
Hydric soil status: Hydric

Anita taxadjunct clay and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Toeslopes on volcanic ridges
Hydric soil status: Hydric

Soils that have a gravelly duripan
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Hydric

104—Bosquejo clay, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Row crops, grain crops, hay, and orchard crops
Major land resource area: 17

Landscape: Sacramento Valley
Elevation: 110 to 190 feet (35 to 59 meters)
Mean annual precipitation: 21 to 25 inches (533 to 635 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Bosquejo clay—85 percent
Minor components—15 percent

Characteristics of Bosquejo Clay

Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Parent material: Clayey alluvium over loamy alluvium derived from volcanic rocks
Observed vegetation: Row crops and prune and almond orchards
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 12 to 60 inches
- *Available water capacity:* High (about 9.7 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 2w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 35 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 8 inches; clay
- Bss1—8 to 19 inches; clay
- Bss2—19 to 24 inches; clay
- 2Bk—24 to 37 inches; silty clay
- 2Bw1—37 to 44 inches; clay loam
- 2Bw2—44 to 46 inches; loam
- 2Bq—46 to 60 inches; loam

Minor Components in Map Unit 104

Busacca clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Galt clay and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Fan terraces
Hydric soil status: Hydric

Haploxerolls clay loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Kusalslough silt loam and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Edjobe silty clay and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

105—Busacca clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Irrigated pasture, row crops, grain crops, orchard crops, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 245 feet (37 to 75 meters)
Mean annual precipitation: 20 to 27 inches (508 to 686 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Busacca clay loam—85 percent
Minor components—15 percent

Characteristics of Busacca Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Parent material: Clayey alluvium over loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and prune orchards, pasture grasses, wheat, and valley oak
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare

Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 30 to 80 inches
Available water capacity: Very high (about 11.3 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2s-2
Land capability, nonirrigated: 3s-2
Storie index: 76 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 3 inches; clay loam
A—3 to 8 inches; clay loam
Bw1—8 to 16 inches; clay loam
Bw2—16 to 28 inches; silty clay loam
Bw3—28 to 43 inches; silty clay loam
Bw4—43 to 60 inches; clay loam
Bw5—60 to 72 inches; clay loam

Minor Components in Map Unit 105

Bosquejo clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Edjobe silty clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

108—Tuscan-Igo-Anita complex, 0 to 3 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 170 to 195 feet (52 to 60 meters)
Mean annual precipitation: 23 inches (584 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Tuscan gravelly loam—45 percent

Igo gravelly loam—20 percent
Anita clay—15 percent
Minor components—20 percent

Characteristics of Tuscan Gravelly Loam

Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, rounded gravel, 0 to 5 percent rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 1.5 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Storie index: 6 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 4 inches; clay loam
Bt2—4 to 7 inches; gravelly clay
Bt3—7 to 11 inches; cobbly clay
2Bqm—11 inches; cemented, gravelly duripan

Characteristics of Igo Gravelly Loam

Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Parent material: Loamy alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 2 to 50 percent medium, rounded gravel, 0 to 5 percent rounded cobbles
Depth to a restrictive feature (duripan): 4 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 10 inches
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Storie index: 5 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly clay loam
Bt2—5 to 9 inches; gravelly clay loam
2Bqm—9 inches; duripan

Characteristics of Anita Clay

Slope: 0 to 3 percent
Geomorphic position: Depressions and swales on fan terraces
Parent material: Clayey alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 0 to 25 percent well rounded cobbles, 0 to 2 percent well rounded stones
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 2.2 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6s-5
Land capability, nonirrigated: 6s-5
Storie index: 3 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 1 inch; clay
A2—1 to 3 inches; clay
Bss1—3 to 10 inches; clay
Bss2—10 to 15 inches; clay
2Bkqm—15 to 20 inches; duripan

Minor Components in Map Unit 108

Redtough and similar soils
Composition: 11 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Areas where a duripan or volcanic sediments crop out
Composition: 5 percent

Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Soils that formed in human-transported fill more than 60 inches thick
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Ripped and leveled fan terraces
Hydric soil status: Not hydric

Tuscan taxadjunct and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

109—Bosquejo clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Orchard and grain crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 200 feet (43 to 62 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Bosquejo clay loam—85 percent
Minor components—15 percent

Characteristics of Bosquejo Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Parent material: Clayey alluvium over loamy alluvium derived from volcanic rocks
Observed vegetation: Grain crops and prune and almond orchards
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 12 to 60 inches
Available water capacity: High (about 9.4 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2
Storie index: 62 (revised)

Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 5 inches; clay loam
Bss1—5 to 24 inches; clay
Bss2—24 to 40 inches; clay
2Bw—40 to 60 inches; loam

Minor Components in Map Unit 109

Haploxerolls clay loam and similar soils
Composition: 10 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that are occasionally flooded
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

Bosquejo taxadjunct clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

110—Bosquejo silt loam, 0 to 1 percent slopes, overwash, occasionally flooded

Map Unit Setting

General location: Northwestern Butte County
Major uses: Row crops and orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 131 to 135 feet (40 to 41 meters)
Mean annual precipitation: 21 to 22 inches (533 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Bosquejo silt loam, overwash, occasionally flooded—90 percent
Minor components—10 percent

Characteristics of Bosquejo Silt Loam, Overwash, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood plains
Parent material: Silty alluvium derived from igneous, metamorphic, and sedimentary rocks over clayey alluvium over loamy alluvium derived from volcanic rocks
Observed vegetation: Row crops, almond orchards, and walnut orchards
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None

Restrictive feature: None identified
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 12 to 60 inches
Available water capacity: Very high (about 10.3 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2
Storie index: 69 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 8 inches; silt loam
2Ab—8 to 22 inches; clay
2Bssb—22 to 40 inches; clay
3Bwb1—40 to 55 inches; clay loam
3Bwb2—55 to 70 inches; clay loam

Minor Components in Map Unit 110

Bosquejo clay and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

Parrott silt loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Busacca clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

111yu—Auburn-Sobrante complex, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Woodland, livestock grazing, homesite development, wildlife habitat, and irrigated pasture

Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 25 to 1,095 feet (8 to 335 meters)
Mean annual precipitation: 22 to 28 inches (558 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 270 days

Map Unit Composition

Auburn loam—40 percent
Sobrante loam—40 percent
Minor components—20 percent

Characteristics of Auburn Loam

Slope: 8 to 15 percent
Geomorphic position: Convex ridgetops and the upper side slopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone
Observed vegetation: Blue oak and annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 10 to 28 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-8
Land capability, nonirrigated: 4e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A to Bw2—0 to 17 inches; loam
R—17 inches; bedrock

Characteristics of Sobrante Loam

Slope: 8 to 15 percent
Geomorphic position: The lower side slopes and toeslopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone
Observed vegetation: Blue oak, annual grasses and forbs, and scattered foothill pine
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-8
Land capability, nonirrigated: 3e-8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; loam
Bt1 and Bt2—5 to 27 inches; clay loam
Cr—27 to 39 inches; soft or weathered bedrock
R—39 inches; bedrock

Minor Components in Map Unit 111yu

Argonaut and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Dunstone and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Loafercreek and similar soils
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Timbuctoo and similar soils
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Loamy soils that are less than 10 inches deep to bedrock
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

114yu—Auburn-Sobrante complex, gravelly, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Woodland, livestock grazing, homesite development, wildlife habitat, and irrigated pasture
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 295 to 1,945 feet (91 to 594 meters)
Mean annual precipitation: 26 to 35 inches (660 to 889 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Auburn gravelly loam—40 percent
Sobrante gravelly loam—40 percent
Minor components—20 percent

Characteristics of Auburn Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: Convex ridgetops and the upper side slopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone
Observed vegetation: Blue oak, interior live oak, foothill pine, shrubs, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 10 to 28 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-8
Land capability, nonirrigated: 4e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A to Bw2—0 to 17 inches; gravelly loam
R—17 inches; bedrock

Characteristics of Sobrante Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: Concave side slopes and toeslopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone

Observed vegetation: Blue oak, interior live oak, foothill pine, shrubs, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-8
Land capability, nonirrigated: 3e-8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; gravelly loam
Bt1 to Bt3—5 to 35 inches; gravelly clay loam
Cr—35 to 40 inches; soft or weathered bedrock
R—40 inches; bedrock

Minor Components in Map Unit 114yu

Rock outcrop
Composition: 6 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Argonaut and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Timbuctoo and similar soils
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to lithic bedrock
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Soils that are 10 to 40 inches deep to bedrock and have a subsoil of clay loam
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

118—Xerorthents, tailings, 0 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Source of aggregate, recreation, wildlife habitat, and homesite development
Major land resource areas: 17 and 18
Landscape: Sacramento Valley, Butte Creek canyon bottoms in foothills
Elevation: 85 to 1,335 feet (26 to 408 meters)
Mean annual precipitation: 21 to 50 inches (533 to 1,270 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Xerorthents, tailings—80 percent
Minor components—20 percent

Characteristics of Xerorthents, Tailings

Slope: 0 to 50 percent
Geomorphic position: Spoil piles on stream terraces and flood plains
Parent material: Dredged spoil piles from gravelly alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: None or scattered valley oak, cottonwood, California sycamore, willow, Pacific poison oak, blackberry, and annual grasses and forbs; in the Butte Creek canyon area, stands of foothill pine and interior live oak
Surface features: Tailings consist of linear piles of gravel, cobbles, and stones 5 to 40 feet high. They include depressional areas that are often wet. Some areas have been leveled.
Texture of the surface layer: Very gravelly sandy loam
Percentage of the surface covered by rock fragments: 5 to 100 percent coarse, well rounded gravel, 10 to 100 percent well rounded cobbles, 0 to 50 percent subrounded stones
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 60 to 80 inches
- *Available water capacity:* Low (about 3.5 inches)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
Land capability, irrigated: 4e-7
Land capability, nonirrigated: 4e-7
Storie index: 34 (revised)
Hydric soil status: Hydric
Hydrologic soil group: A

Typical profile
A—0 to 3 inches; very gravelly sandy loam
AC—3 to 8 inches; extremely gravelly sandy loam
C1—8 to 21 inches; loamy sand
C2—21 to 26 inches; loamy sand
C3—26 to 35 inches; loamy sand
C4—35 to 48 inches; loamy coarse sand
C5—48 to 59 inches; loamy sand
C6—59 to 81 inches; loamy sand

Minor Components in Map Unit 118

Soils that are in riparian areas
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Pits
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Xerofluvents, tailings, and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Xeropsamments, tailings, and similar soils
Composition: 3 percent
Slope: 0 to 50 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Haploxeralfs, terrace, and similar soils
Composition: 2 percent
Slope: 0 to 8 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Soils that have a duripan
Composition: 2 percent
Slope: 0 to 8 percent
Geomorphic position: Edges of terraces
Hydric soil status: Hydric

118co—Clear Lake clay, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Northeastern Colusa County and southwestern Butte County
Major uses: Irrigated crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 25 to 55 feet (8 to 17 meters)
Mean annual precipitation: 14 to 16 inches (355 to 405 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 225 to 250 days

Map Unit Composition

Clear Lake clay, frequently flooded—90 percent
Minor components—10 percent

Characteristics of Clear Lake Clay, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Alluvium
Observed vegetation: Irrigated crops
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures along the Sacramento River have changed the frequency and duration of flooding and have lowered the water table. Drainage ditches for rice also have lowered the water table.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 48 to 72 inches
- *Available water capacity:* High (about 8.9 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 21.0 (historical number)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap1—0 to 4 inches; clay
- Ap2—4 to 10 inches; clay
- Bss1—10 to 20 inches; clay
- Bss2—20 to 34 inches; clay
- Bss3—34 to 47 inches; clay
- Bssk1—47 to 59 inches; clay
- Bssk2—59 to 79 inches; clay

Minor Components in Map Unit 118co

Willows silty clay, frequently flooded, and similar soils
Composition: 6 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Clear Lake clay, occasionally flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils in channels
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

119—Xerorthents, tailings-Urban land complex, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Homesite development, wildlife habitat, and source of aggregate
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 180 feet (26 to 56 meters)
Mean annual precipitation: 21 to 26 inches (533 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Xerorthents, tailings—70 percent
Urban land—30 percent

Characteristics of Xerorthents, Tailings

Slope: 0 to 2 percent
Geomorphic position: Spoil piles on terraces and flood plains
Parent material: Dredged spoil piles from gravelly alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: None or scattered valley oak, cottonwood, California sycamore, willow, Pacific poison oak, blackberry, and annual grasses and forbs
Surface features: Tailings consist of linear piles of gravel, cobbles, and stones 5 to 40 feet high. They include depressional areas that are often wet. Some areas have been leveled.
Texture of the surface layer: Very gravelly sandy loam
Percentage of the surface covered by rock fragments: 5 to 100 percent coarse, well rounded gravel, 10 to 100 percent well rounded cobbles, 0 to 50 percent subrounded stones
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 60 to 80 inches
Available water capacity: Low (about 3.5 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4e-7
Land capability, nonirrigated: 4e-7
Storie index: 37 (revised)
Hydric soil status: Hydric
Hydrologic soil group: A

Typical profile
A—0 to 3 inches; very gravelly sandy loam
AC—3 to 8 inches; extremely gravelly sandy loam
C1—8 to 21 inches; loamy sand
C2—21 to 26 inches; loamy sand
C3—26 to 35 inches; loamy sand
C4—35 to 48 inches; loamy coarse sand
C5—48 to 59 inches; loamy sand
C6—59 to 81 inches; loamy sand

Characteristics of Urban Land

Slope: 0 to 2 percent
Geomorphic position: Leveled spoil piles on terraces and flood plains
Definition: Urban land generally is covered by streets, parking lots, sidewalks, buildings, and other structures.

119yu—Auburn-Sobrante-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Woodland, livestock grazing, and wildlife habitat
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 295 to 1,945 feet (91 to 594 meters)
Mean annual precipitation: 26 to 35 inches (660 to 889 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Auburn gravelly loam—30 percent
Sobrante gravelly loam—30 percent
Rock outcrop—20 percent
Minor components—20 percent

Characteristics of Auburn Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Ridgetops and the upper side slopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone
Observed vegetation: Blue oak, interior live oak, foothill pine, shrubs, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 10 to 28 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 2.2 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 6e-8
- *Land capability, nonirrigated:* 6e-8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A to Bw2—0 to 17 inches; gravelly loam
- R—17 inches; bedrock

Characteristics of Sobrante Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: The lower side slopes and toeslopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from greenstone
Observed vegetation: Blue oak, interior live oak, foothill pine, shrubs, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6e-8
- *Land capability, nonirrigated:* 6e-8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 5 inches; gravelly loam

Bt1 to Bt3—5 to 35 inches; gravelly clay loam
Cr—35 to 40 inches; soft or weathered bedrock
R—40 inches; bedrock

Characteristics of Rock Outcrop

Slope: 30 to 50 percent
Geomorphic position: Ridgetops and the upper side slopes on metamorphic hills
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 119yu

Hurleton and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Timbuctoo and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Loamy soils that are less than 10 inches deep to bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

120—Gridley taxadjunct clay loam, 0 to 2 percent slopes

Map Unit Setting

General location: Southern Butte County and northern Sutter County
Major uses: Irrigated cropland, irrigated pasture, livestock grazing, homesite development, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 85 feet (18 to 26 meters)
Mean annual precipitation: 18 to 20 inches (457 to 508 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gridley taxadjunct clay loam—80 percent
Minor components—20 percent

Characteristics of Gridley Taxadjunct Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces

Parent material: Clayey and loamy alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, prune orchards, and pasture species
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 5 to 40 inches
Available water capacity: Low (about 3.9 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 3w-8
Land capability, nonirrigated: 3w-8
Storie index: 15 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 4 inches; clay loam
Bt1—4 to 9 inches; clay loam
Bt2—9 to 15 inches; clay loam
Btk—15 to 21 inches; clay loam
2Bkqm—21 to 60 inches; cemented coarse sandy loam

Minor Components in Map Unit 120

Neerdobe clay and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Gridley clay loam, siltstone substratum, and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Gridley taxadjunct loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Subaco taxadjunct clay and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Marcum clay loam and similar soils
Composition: 2 percent

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Tisdale clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Sodic soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Gridley taxadjunct, frequently ponded, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

121—Boga-Loemstone complex, 0 to 1 percent slopes

Map Unit Setting

General location: South-central Butte County and northern Sutter County
Major uses: Orchard crops, irrigated pasture, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 100 feet (23 to 32 meters)
Mean annual precipitation: 19 to 21 inches (483 to 533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Boga loam—45 percent
Loemstone loam—40 percent
Minor components—15 percent

Characteristics of Boga Loam

Slope: 0 to 1 percent
Geomorphic position: Terraces along the Feather River
Parent material: Loamy alluvium over dense silty alluvium derived from igneous and metamorphic rocks
Observed vegetation: Walnut, kiwi, and peach orchards and valley oak
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 20 to 80 inches

Available water capacity: Very high (about 12.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 2s-3
Land capability, nonirrigated: 3s-3
Storie index: 84 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 3 inches; loam
Ap2—3 to 6 inches; loam
Bt1—6 to 14 inches; clay loam
Bt2—14 to 29 inches; clay loam
Bt3—29 to 53 inches; clay loam
Bt4—53 to 73 inches; loam
2Cd—73 to 80 inches; dense material

Characteristics of Loemstone Loam

Slope: 0 to 1 percent
Geomorphic position: Terraces along the Feather River
Parent material: Loamy alluvium over dense silty alluvium derived from igneous and metamorphic rocks
Observed vegetation: Walnut, peach, and kiwi orchards and valley oak
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 18 to 60 inches
Available water capacity: High (about 9.5 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3s-3
Land capability, nonirrigated: 3s-3
Storie index: 54 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 2 inches; loam
Ap2—2 to 4 inches; silt loam
Ap3—4 to 10 inches; silt loam
Bt1—10 to 18 inches; clay loam
Bt2—18 to 23 inches; silty clay loam
Bt3—23 to 32 inches; silt loam
Bt4—32 to 40 inches; silt loam
Bt5—40 to 48 inches; silt loam
2Cd—48 to 57 inches; dense material

Minor Components in Map Unit 121

Soils that are 20 to 40 inches deep to densic material
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Liveoak sandy clay loam and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Distributary channels
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Tisdale clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Marcum loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Coarse-loamy soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Distributary channels
Hydric soil status: Not hydric

121su—Columbia fine sandy loam, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Sutter and Butte Counties
Major uses: Irrigated orchard crops and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 20 to 80 feet (7 to 25 meters)
Mean annual precipitation: 17 to 22 inches (431 to 559 millimeters)
Mean annual air temperature: 60 to 64 degrees F (16 to 18 degrees C)
Frost-free period: 260 to 280 days

Map Unit Composition

Columbia fine sandy loam, frequently flooded—80 percent
Minor components—20 percent

Characteristics of Columbia Fine Sandy Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Flood plains
Parent material: Sandy alluvium derived from mixed sources
Observed vegetation: Mixed riparian vegetation and walnut orchards
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 36 to 60 inches
Available water capacity: Moderate (about 6.5 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4w
Land capability, nonirrigated: 4w
Storie index: 53.0 (historical number)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
Ap or A—0 to 14 inches; fine sandy loam
C1 to C4—14 to 60 inches; stratified fine sandy loam to very fine sandy loam

Minor Components in Map Unit 121su

Holillipah and similar soils
Composition: 7 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Tisdale and similar soils
Composition: 7 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Shanghai and similar soils
Composition: 6 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

125—Gridley taxadjunct-Calcic Haploxerolls complex, 0 to 2 percent slopes

Map Unit Setting

General location: Southern Butte County
Major uses: Irrigated cropland, irrigated pasture, homesite development, and wildlife habitat

Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 95 feet (18 to 30 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gridley taxadjunct loam—65 percent
Calcic Haploxerolls sandy loam—20 percent
Minor components—15 percent

Characteristics of Gridley Taxadjunct Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Parent material: Loamy and clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and pasture species
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* Occasional
- *Depth to a water table (zone of saturation):* 5 to 40 inches
- *Available water capacity:* Low (about 3.9 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 3w-8
- *Land capability, nonirrigated:* 3w-8
- *Storie index:* 17 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 10 inches; loam
- Bt—10 to 20 inches; clay loam
- Btk—20 to 22 inches; clay
- 2Bkqm—22 to 60 inches; duripan

Characteristics of Calcic Haploxerolls Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Convex areas on low terraces
Parent material: Loamy alluvium over dense, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and pasture species
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Hydrology has been altered in areas leveled for agriculture.
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 30 to 60 inches
Available water capacity: Moderate (about 5.6 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3s-6
Land capability, nonirrigated: 3s-6
Storie index: 67 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; sandy loam
Ak—5 to 17 inches; sandy loam
Bk1—17 to 20 inches; sandy loam
Bk2—20 to 33 inches; sandy loam
C—33 to 44 inches; sandy loam
2Cd—44 to 72 inches; dense material

Minor Components in Map Unit 125

Subaco taxadjunct clay and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Marcum clay loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to a duripan
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

126—Liveoak sandy loam, 0 to 2 percent slopes

Map Unit Setting

General location: South-central Butte County and northern Sutter County
Major uses: Irrigated crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 110 feet (26 to 34 meters)
Mean annual precipitation: 19 to 21 inches (483 to 533 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Liveoak sandy loam—85 percent
Minor components—15 percent

Characteristics of Liveoak Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Distributary channels on terraces along the Feather River
Parent material: Loamy and sandy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Alfalfa and peach, prune, and walnut orchards
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Because of the protection provided by levees, water very rarely flows into distributary channels.
- *Annual flooding frequency:* Very rare
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 11 to 40 inches
- *Available water capacity:* Moderate (about 7.5 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 2s-2
- *Land capability, nonirrigated:* 3s-2
- *Storie index:* 84 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Ap1—0 to 4 inches; sandy loam
- Ap2—4 to 17 inches; sandy loam
- Bw1—17 to 37 inches; sandy loam
- Bw2—37 to 48 inches; sandy loam
- Bw3—48 to 61 inches; sandy loam
- C1—61 to 71 inches; sand
- C2—71 to 75 inches; gravelly sand

Minor Components in Map Unit 126

Soils that have a light colored surface layer
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Boga loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Loemstone loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Gridley taxadjunct clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Xerofluvents, coarse-loamy, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Distributary channels
Hydric soil status: Not hydric

Liveoak sandy clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Distributary channels
Hydric soil status: Not hydric

Urban land
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Leveled land

127—Gridley taxadjunct loam, 0 to 2 percent slopes

Map Unit Setting

General location: Southern Butte County and northern Sutter County
Major uses: Irrigated crops, livestock grazing, irrigated pasture, homesite development, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 95 feet (20 to 30 meters)
Mean annual precipitation: 18 to 21 inches (457 to 533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gridley taxadjunct loam—85 percent
Minor components—15 percent

Characteristics of Gridley Taxadjunct Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Parent material: Loamy and clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and pasture species
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None

Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 5 to 40 inches
Available water capacity: Low (about 3.9 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3w-8
Land capability, nonirrigated: 3w-8
Storie index: 17 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 10 inches; loam
Bt—10 to 20 inches; clay loam
Btk—20 to 22 inches; clay
2Bkqm—22 to 60 inches; duripan

Minor Components in Map Unit 127

Soils that are frequently flooded
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Channels on low terraces
Hydric soil status: Hydric

Mollic Haploxeralfs, fine-loamy, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Typic Argixerolls, fine-loamy, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Typic Haploxerolls, fine-loamy, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent

Geomorphic position: Low terraces
Hydric soil status: Not hydric

130—Eastbiggs loam, 0 to 2 percent slopes

Map Unit Setting

General location: Southern Butte County
Major uses: Cropland, livestock grazing, watershed, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 120 feet (27 to 38 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Eastbiggs loam—80 percent
Minor components—20 percent

Characteristics of Eastbiggs Loam

Slope: 0 to 2 percent
Geomorphic position: Mounds on low terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and some crops
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Natural hydrology has been modified in areas leveled for agriculture.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 14 to 40 inches
- *Available water capacity:* Low (about 4.5 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 22 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A1—0 to 3 inches; loam
- A2—3 to 10 inches; loam
- BAt—10 to 17 inches; loam
- 2Bt—17 to 27 inches; clay
- 3Bqm—27 to 34 inches; duripan
- 3Bq—34 to 60 inches; duripan

Minor Components in Map Unit 130

Galt clay and similar soils
Composition: 9 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on low terraces
Hydric soil status: Hydric

Clayey soils that are 10 to 20 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on low terraces
Hydric soil status: Hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on low terraces
Hydric soil status: Hydric

Kimball loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 percent
Geomorphic position: Vernal pools on low terraces
Hydric soil status: Hydric

Soils that are rarely flooded
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

133—Eastbiggs-Galt complex, 0 to 3 percent slopes

Map Unit Setting

General location: Central and southern Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and some cropland
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 140 feet (21 to 43 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Eastbiggs loam—50 percent
Galt clay loam—40 percent
Minor components—10 percent

Characteristics of Eastbiggs Loam

Slope: 0 to 3 percent
Geomorphic position: Mounds on low terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and some crops
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Natural hydrology has been modified in areas leveled for agriculture.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 14 to 40 inches
- *Available water capacity:* Low (about 4.5 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 21 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A1—0 to 3 inches; loam
- A2—3 to 10 inches; loam
- BAt—10 to 17 inches; loam
- 2Bt—17 to 27 inches; clay
- 3Bqm—27 to 34 inches; duripan
- 3Bq—34 to 60 inches; duripan

Characteristics of Galt Clay Loam

Slope: 0 to 3 percent
Geomorphic position: Drainageways and depressions on low terraces
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and some crops
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent

Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 18 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 6 inches; clay loam
Bss1—6 to 20 inches; clay loam
Bss2—20 to 27 inches; clay
Bss3—27 to 30 inches; clay
2Bqm—30 inches; duripan

Minor Components in Map Unit 133

Kimball loam and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Esquon clay and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Drainageways and small basins on low terraces
Hydric soil status: Hydric

Wet soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Hydric

Wilsoncreek loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

136—Duric Xerarents-Eastbiggs complex, 0 to 1 percent slopes, leveled

Map Unit Setting

General location: Central Butte County
Major uses: Irrigated crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 140 feet (21 to 43 meters)
Mean annual precipitation: 19 to 23 inches (483 to 584 millimeters)

Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Duric Xerarents, cut—35 percent
Duric Xerarents, fill—30 percent
Eastbiggs fine sandy loam, leveled—25 percent
Minor components—10 percent

Characteristics of Duric Xerarents, Cut

Slope: 0 to 1 percent
Geomorphic position: Cut areas on low terraces
Parent material: Human-altered, clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agricultural production. A typical pedon rarely occurs in this unit because of cuts and fills during leveling. Only remnant horizons or parts of the original soil remain. Surface horizons have been removed by leveling.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 6 to 21 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 21 inches
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 15 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Bt1—0 to 3 inches; clay loam
Bt2—3 to 8 inches; clay loam
Bt3—8 to 10 inches; clay loam
2Bt4—10 to 13 inches; clay
3Bqm—13 inches; duripan

Characteristics of Duric Xerarents, Fill

Slope: 0 to 1 percent
Geomorphic position: Filled areas on low terraces
Parent material: Human-transported, clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs

Surface features: The surface has been leveled for agricultural production. A typical pedon rarely occurs in this unit because of cuts and fills during leveling. Only remnant horizons or parts of the original soil remain. Human-transported fill has been deposited on natural soil horizons.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 24 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Natural hydrology has been modified by leveling.
Annual flooding frequency: None
Annual ponding frequency: Rare
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 4w-5
Land capability, nonirrigated: 4w-5
Storie index: 63 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 5 inches; clay loam
Btb1—5 to 12 inches; clay loam
Btb2—12 to 16 inches; clay
Bqb—16 to 30 inches; cemented sandy loam
Btb3—30 to 38 inches; sandy clay loam
Btb4—38 to 48 inches; sandy clay loam
2Bqmb—48 inches; duripan

Characteristics of Eastbiggs Fine Sandy Loam, Leveled

Slope: 0 to 1 percent
Geomorphic position: Leveled mounds on low terraces
Parent material: Human-transported, loamy alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agricultural production. A typical pedon rarely occurs in this unit because of cuts and fills during leveling. Only remnant horizons or parts of the original soil remain.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Natural hydrology has been altered by leveling for agriculture.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 14 to 40 inches
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 24 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 5 inches; fine sandy loam
Ap2—5 to 12 inches; fine sandy loam
Btb1—12 to 18 inches; sandy clay loam
Btb2—18 to 23 inches; sandy clay loam
Btb3—23 to 26 inches; clay loam
Btb4—26 to 30 inches; clay
2Bqmb—30 inches; duripan

Minor Components in Map Unit 136

Duric Xerarents, cut and fill with gravel, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled land on low terraces
Hydric soil status: Not hydric

Esquon, human-transported fill overburden, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Filled drainageways and sloughs on low terraces
Hydric soil status: Hydric

Soils that formed in human-transported fill more than 60 inches thick
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Fill on low terraces
Hydric soil status: Not hydric

138su—Liveoak sandy clay loam, 0 to 2 percent slopes

Map Unit Setting

General location: Northern Sutter County and southern Butte County
Major uses: Irrigated crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 15 to 95 feet (6 to 29 meters)
Mean annual precipitation: 17 to 21 inches (432 to 533 millimeters)
Mean annual air temperature: 61 to 64 degrees F (16 to 18 degrees C)
Frost-free period: 240 to 280 days

Map Unit Composition

Liveoak sandy clay loam—85 percent
Minor components—15 percent

Characteristics of Liveoak Sandy Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Parent material: Loamy alluvium derived from igneous and metamorphic rocks

Observed vegetation: Alfalfa and peach, walnut, almond, and prune orchards
Surface feature: Most areas have been leveled for agricultural production.
Texture of the surface layer: Sandy clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Because of the protection provided by levees, water very rarely flows into distributary channels.
Annual flooding frequency: Very rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 11 to 40 inches
Available water capacity: High (about 9.9 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2s-2
Land capability, nonirrigated: 3s-2
Storie index: 84 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap1 and Ap2—0 to 13 inches; sandy clay loam
Bt1, Bt2, and BC—13 to 53 inches; sandy clay loam
C—53 to 60 inches; sandy loam

Minor Components in Map Unit 138su

Liveoak sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Tisdale clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Boga loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Loemstone loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent

Geomorphic position: Terraces
Hydric soil status: Not hydric

Gridley taxadjunct clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to a sandy substratum
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Distributary channels
Hydric soil status: Not hydric

Soils that have a light colored surface layer
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that do not have a water table
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

139su—Liveoak-Galt taxadjuncts complex, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Northwestern Sutter County and southwestern Butte County
Major uses: Irrigated crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 20 to 65 feet (7 to 20 meters)
Mean annual precipitation: 14 to 20 inches (355 to 508 millimeters)
Mean annual air temperature: 60 to 64 degrees F (16 to 18 degrees C)
Frost-free period: 260 to 280 days

Map Unit Composition

Liveoak taxadjunct loam, frequently flooded—45 percent
Galt taxadjunct clay loam, frequently flooded—40 percent
Minor components—15 percent

Characteristics of Liveoak Taxadjunct Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Parent material: Loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses, tules, and rice
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 48 to 60 inches
Available water capacity: High (about 8.6 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4w-2
Land capability, nonirrigated: 4w-2
Storie index: 31.0 (historical number)
Hydric soil status: Hydric
Hydrologic soil group: B

Typical profile
Ak—0 to 6 inches; loam
Bk and Bkq—6 to 54 inches; loam
Bkqm—54 to 63 inches; duripan
2C—63 to 73 inches; very fine sandy loam

Characteristics of Galt Taxadjunct Clay Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Channels on flood plains
Parent material: Loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses, tules, and rice
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature: 20 to 35 inches to a duripan; 26 to 60 inches to densic material
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 12 to 24 inches
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 14.0 (historical number)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
A1, A2, Bw, and Bk—0 to 21 inches; clay loam
Bkqm—21 to 22 inches; duripan
Ck—22 to 25 inches; loam
B´kqm—25 to 26 inches; duripan
Cd—26 inches; densic material

Minor Components in Map Unit 139su

Galt clay and similar soils
Composition: 4 percent

Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Subaco clay and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Clear Lake clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Columbia and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Gridley clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

143su—Marcum-Gridley clay loams, 0 to 1 percent slopes

Map Unit Setting

General location: Sutter County and southern Butte County
Major uses: Irrigated and nonirrigated crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 20 to 80 feet (7 to 25 meters)
Mean annual precipitation: 17 to 20 inches (431 to 508 millimeters)
Mean annual air temperature: 60 to 64 degrees F (16 to 18 degrees C)
Frost-free period: 260 to 280 days

Map Unit Composition

Marcum clay loam—45 percent
Gridley clay loam—40 percent
Minor components—15 percent

Characteristics of Marcum Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Basin rims and terraces
Parent material: Loamy alluvium derived from mixed sources

Observed vegetation: Rice, prune orchards, corn, tomatoes, grain sorghum, safflower, and nonirrigated wheat and barley
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2s-3
Land capability, nonirrigated: 3s-3
Storie index: 58.0 (historical number)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap or A—0 to 16 inches; clay loam
Bt1—16 to 28 inches; clay loam
Bt2—28 to 40 inches; clay
Bk—40 to 43 inches; clay loam
2Cr—43 to 62 inches; bedrock

Characteristics of Gridley Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Basin rims and terraces
Parent material: Clayey alluvium derived from mixed sources
Observed vegetation: Rice, prune orchards, corn, tomatoes, grain sorghum, safflower, and nonirrigated wheat and barley
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.5 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3s-3
Land capability, nonirrigated: 3s-3
Storie index: 44.0 (historical number)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap and A—0 to 19 inches; clay loam
Bt1 and Bt2—19 to 37 inches; clay
2Cr—37 inches; bedrock

Minor Components in Map Unit 143su

Liveoak and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Tisdale and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Capay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Basin rims
Hydric soil status: Hydric

Conejo and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Gridley and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Oswald and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Basin rims
Hydric soil status: Hydric

Soils that are frequently ponded
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Basin rims
Hydric soil status: Hydric

149yu—Flanly sandy loam, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Woodland, livestock grazing, homesite development, irrigated pasture, and wildlife habitat
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills

Elevation: 120 to 1,895 feet (38 to 579 meters)
Mean annual precipitation: 22 to 42 inches (559 to 1,067 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 255 days

Map Unit Composition

Flanly sandy loam—80 percent
Minor components—20 percent

Characteristics of Flanly Sandy Loam

Slope: 8 to 15 percent
Geomorphic position: Hills
Parent material: Residuum weathered from granodiorite
Observed vegetation: Interior live oak, blue oak, foothill pine, brush, annual grasses and forbs, and scattered ponderosa pine
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A and BAt—0 to 9 inches; sandy loam
Bt1—9 to 16 inches; loam
Bt2 and Bt3—16 to 34 inches; loam
Cr—34 to 38 inches; bedrock

Minor Components in Map Unit 149yu

Orose and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Rackerby and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Swedesflat and similar soils
Composition: 5 percent
Slope: 8 to 15 percent

Geomorphic position: Hills
Hydric soil status: Not hydric

Verjeles and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

150—Columbia, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Western and south-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 170 feet (20 to 52 meters)
Mean annual precipitation: 19 to 23 inches (483 to 584 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Columbia stratified sand to fine sandy loam—85 percent
Minor components—15 percent

Characteristics of Columbia Stratified Sand to Fine Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Channels and sloughs on flood plains
Parent material: Stratified, sandy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Riparian species, including California sycamore, willows, black walnut, cottonwood, valley oak, wild grape, shrubs, and grasses
Surface feature: Flooding debris, such as logs, limbs, leaves, and grass, is deposited and moved across the surface annually.
Texture of the surface layer: Stratified sand to fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 20 to 72 inches
- *Available water capacity:* Moderate (about 6.7 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2

Storie index: 35 (revised)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
A—0 to 5 inches; stratified sand to fine sandy loam
C1—5 to 10 inches; stratified silt loam to sandy loam
C2—10 to 29 inches; loam
C3—29 to 37 inches; fine sandy loam
C4—37 to 46 inches; sand
C5—46 to 60 inches; stratified fine sandy loam to fine sand

Minor Components in Map Unit 150

Gianella fine sandy loam, loam, or silt loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Hydric

Parrott silt loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Hydric

Riverwash
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Gravel bars in channels
Hydric soil status: Hydric

150su—Olashes sandy loam, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Sutter County and southwestern Butte County
Major uses: Irrigated and nonirrigated crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 45 to 750 feet (14 to 229 meters)
Mean annual precipitation: 16 to 19 inches (406 to 482 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 250 to 270 days

Map Unit Composition

Olashes sandy loam—85 percent
Minor components—15 percent

Characteristics of Olashes Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Loamy alluvium derived from mixed sources
Observed vegetation: Almond, walnut, peach, and prune orchards, rice, and dry beans
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None

Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 1
Land capability, nonirrigated: 3c
Storie index: 86.0 (historical number)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 4 inches; sandy loam
Bt1 and Bt2—4 to 52 inches; sandy clay loam
2C—52 to 60 inches; sand

Minor Components in Map Unit 150su

Oswald and similar soils
Composition: 8 percent
Slope: 0 to 2 percent
Geomorphic position: Basin rims
Hydric soil status: Hydric

Soils that are 40 to 60 inches deep to bedrock or a duripan
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Subaco and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Basin rims
Hydric soil status: Hydric

151yu—Flanly sandy loam, 30 to 50 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Woodland, livestock grazing, and wildlife habitat
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 120 to 1,895 feet (38 to 579 meters)
Mean annual precipitation: 22 to 42 inches (559 to 1,067 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 255 days

Map Unit Composition

Flanly sandy loam—80 percent
Minor components—20 percent

Characteristics of Flanly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Hills
Parent material: Residuum weathered from granodiorite
Observed vegetation: Interior live oak, blue oak, foothill pine, brush, annual grasses and forbs, and scattered ponderosa pine
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A and BAt—0 to 9 inches; sandy loam
Bt1—9 to 16 inches; loam
Bt2 and Bt3—16 to 34 inches; loam
Cr—34 to 38 inches; soft or weathered bedrock

Minor Components in Map Unit 151yu

Hurleton and similar soils
Composition: 4 percent
Slope: 30 to 40 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Orose and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Rackerby and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Sommeyflat and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Swedesflat and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

152—Gianella fine sandy loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western and southern Butte County
Major uses: Orchard crops, row crops, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 160 feet (23 to 49 meters)
Mean annual precipitation: 20 to 22 inches (508 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gianella fine sandy loam, frequently flooded—85 percent
Minor components—15 percent

Characteristics of Gianella Fine Sandy Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond, walnut, and prune orchards; wheat; and, in riparian forest areas, valley oak, California boxelder, cottonwood, and willows
Surface feature: Texture of the surface layer varies and may change because of deposition during periods of flooding.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 33 to 80 inches
Available water capacity: High (about 8.8 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 4w-2

Land capability, nonirrigated: 4w-2
Storie index: 66 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
A—0 to 6 inches; fine sandy loam
C1—6 to 15 inches; silt loam
C2—15 to 20 inches; fine sandy loam
C3—20 to 22 inches; silt loam
C4—22 to 27 inches; silt loam
C5—27 to 32 inches; fine sandy loam
C6—32 to 43 inches; fine sandy loam
C7—43 to 64 inches; fine sandy loam
C8—64 to 80 inches; loamy sand

Minor Components in Map Unit 152

Parrott silt loam, frequently flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Soils that have a gravelly substratum
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Frequently flooded Columbia and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Gianella fine sandy loam, occasionally flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

153—Gianella sandy loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 150 feet (30 to 47 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gianella sandy loam, frequently flooded—85 percent
Minor components—15 percent

Characteristics of Gianella Sandy Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Annual grasses and forbs and, in riparian forest areas, valley oak, California boxelder, cottonwoods, and willows
Surface feature: Texture of the surface layer varies and may change because of deposition during periods of flooding.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 33 to 80 inches
Available water capacity: Moderate (about 7.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 4w-2
Land capability, nonirrigated: 4w-2
Storie index: 63 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
A—0 to 6 inches; sandy loam
C1—6 to 17 inches; sandy loam
C2—17 to 24 inches; sandy loam
C3—24 to 29 inches; sandy loam
C4—29 to 32 inches; loamy sand
C5—32 to 43 inches; fine sandy loam
C6—43 to 57 inches; fine sandy loam
C7—57 to 67 inches; fine sandy loam
C8—67 to 68 inches; fine sandy loam
C9—68 to 71 inches; fine sandy loam
C10—71 to 80 inches; fine sandy loam
C11—80 to 84 inches; fine sandy loam

Minor Components in Map Unit 153

Frequently flooded Columbia and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Soils that have a gravelly substratum
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Riverwash
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Gravel bars in channels
Hydric soil status: Hydric

Parrott silt loam, frequently flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

154—Gianella silt loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Orchard crops, row crops, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 160 feet (26 to 49 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Gianella silt loam, frequently flooded—85 percent
Minor components—15 percent

Characteristics of Gianella Silt Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut, almond, and prune orchards; wheat; and, in riparian forest areas, valley oak, California boxelder, cottonwoods, and willows
Surface feature: Texture of the surface layer varies and may change because of deposition during periods of flooding.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: 0 to 20 percent well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 33 to 80 inches

Available water capacity: High (about 8.8 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 4w-2
Land capability, nonirrigated: 4w-2
Storie index: 66 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
A—0 to 2 inches; silt loam
C1—2 to 8 inches; loamy fine sand
C2—8 to 15 inches; fine sandy loam
C3—15 to 22 inches; very fine sandy loam
C4—22 to 31 inches; very fine sandy loam
C5—31 to 41 inches; very fine sandy loam
C6—41 to 50 inches; silt loam
C7—50 to 54 inches; silt loam
C8—54 to 64 inches; silt loam
C9—64 to 66 inches; silt loam
C10—66 to 69 inches; loam
C11—69 to 83 inches; loamy fine sand

Minor Components in Map Unit 154

Parrott silt loam, frequently flooded, and similar soils
Composition: 9 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Frequently flooded Columbia and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Soils that have a gravelly substratum
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Gianella silt loam, occasionally flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

158—Gianella fine sandy loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Western and southern Butte County
Major uses: Orchard crops, row crops, wildlife habitat, and watershed

Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 170 feet (21 to 53 meters)
Mean annual precipitation: 19 to 23 inches (483 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Gianella fine sandy loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Gianella Fine Sandy Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut, almond, and prune orchards; wheat; and, in riparian forest areas, valley oak, California boxelder, cottonwoods, and willows
Surface feature: Texture of the surface layer varies and may change because of deposition during periods of flooding.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 33 to 80 inches
- *Available water capacity:* High (about 8.0 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 2w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 80 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile
- Ap—0 to 3 inches; fine sandy loam
- A—3 to 12 inches; fine sandy loam
- C1—12 to 19 inches; loam
- C2—19 to 28 inches; fine sandy loam
- C3—28 to 48 inches; loam
- C4—48 to 57 inches; sandy loam
- C5—57 to 80 inches; loamy sand

Minor Components in Map Unit 158

Parrott silt loam, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Soils that have a gravelly substratum
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Frequently flooded Columbia and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Gianella fine sandy loam, frequently flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Not hydric

Farwell loam and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Edges of flood plains
Hydric soil status: Not hydric

160—Gianella loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Western and southern Butte County
Major uses: Orchard crops, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 150 feet (30 to 46 meters)
Mean annual precipitation: 20 to 22 inches (515 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Gianella loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Gianella Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut, almond, and prune orchards and, in riparian forest areas, valley oak, California boxelder, and willows
Surface feature: Texture of the surface layer varies and may change because of deposition during periods of flooding.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 20 percent rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 33 to 80 inches
Available water capacity: High (about 8.3 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2
Storie index: 80 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Ap—0 to 18 inches; loam
C1—18 to 42 inches; fine sandy loam
C2—42 to 52 inches; fine sandy loam
C3—52 to 70 inches; loamy sand

Minor Components in Map Unit 160

Frequently flooded Columbia and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Parrott silt loam, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Soils that have a gravelly substratum
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

161—Gianella fine sandy loam, 0 to 1 percent slopes, rarely flooded

Map Unit Setting

General location: Southern Butte County
Major uses: Orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 110 feet (27 to 35 meters)
Mean annual precipitation: 20 to 22 inches (515 to 559 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Gianella fine sandy loam, rarely flooded—90 percent
Minor components—10 percent

Characteristics of Gianella Fine Sandy Loam, Rarely Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut orchards and valley oak
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 33 to 80 inches
Available water capacity: High (about 8.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2s-4
Land capability, nonirrigated: 3s-4
Storie index: 85 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Ap—0 to 3 inches; fine sandy loam
A—3 to 12 inches; fine sandy loam
C1—12 to 19 inches; loam
C2—19 to 28 inches; fine sandy loam
C3—28 to 48 inches; loam
C4—48 to 57 inches; sandy loam
C5—57 to 80 inches; loamy sand

Minor Components in Map Unit 161

Soils that have a gravelly substratum
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Columbia taxadjunct very fine sandy loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Gianella fine sandy loam, occasionally flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent

Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

162—Gianella loam, 0 to 1 percent slopes, rarely flooded

Map Unit Setting

General location: Southern Butte County
Major uses: Orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 110 feet (29 to 34 meters)
Mean annual precipitation: 20 inches (515 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Gianella loam, rarely flooded—90 percent
Minor components—10 percent

Characteristics of Gianella Loam, Rarely Flooded

Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Parent material: Stratified, coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut orchards and valley oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 20 percent rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 33 to 80 inches
- *Available water capacity:* High (about 8.3 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 2s-4
- *Land capability, nonirrigated:* 3s-4
- *Storie index:* 85 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile
- Ap—0 to 18 inches; loam
- C1—18 to 42 inches; fine sandy loam
- C2—42 to 52 inches; fine sandy loam
- C3—52 to 70 inches; loamy sand

Minor Components in Map Unit 162

Soils that have a gravelly substratum
Composition: 5 percent
Slope: 0 to 1 percent

Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Columbia taxadjunct very fine sandy loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

163yu—Holillipah loamy sand, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Irrigated orchard crops and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 30 to 130 feet (10 to 40 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 59 to 66 degrees F (15 to 19 degrees C)
Frost-free period: 250 to 290 days

Map Unit Composition

Holillipah loamy sand—85 percent
Minor components—15 percent

Characteristics of Holillipah Loamy Sand

Slope: 0 to 1 percent
Geomorphic position: Flood plains
Parent material: Sandy alluvium derived from mixed sources
Observed vegetation: Riparian trees, dense brush, and walnut orchards
Texture of the surface layer: Loamy sand
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.7 inches)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 12.0 (historical number)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* A

Typical profile
- Ap—0 to 6 inches; loamy sand
- C1 to C8—6 to 66 inches; stratified sand to silt loam

Minor Components in Map Unit 163yu

Columbia and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Occasionally flooded Holillipah and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Shanghai and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

165yu—Holland-Hoda-Hotaw complex, 2 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,795 feet (610 to 1,158 meters)
Mean annual precipitation: 50 to 75 inches (1,270 to 1,905 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 160 to 235 days

Map Unit Composition

Holland loam—40 percent
Hoda loam—25 percent
Hotaw loam—20 percent
Minor components—15 percent

Characteristics of Holland Loam

Slope: 2 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Fine-loamy colluvium and residuum derived from granodiorite
Observed vegetation: Mixed conifers, hardwoods, shrubs, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.3 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1 and A2—0 to 15 inches; loam
Bt1 to BCt—15 to 65 inches; clay loam

Characteristics of Hoda Loam

Slope: 2 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Clayey colluvium and residuum weathered from granodiorite
Observed vegetation: Mixed conifers, hardwoods, shrubs, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—1 inch to 0; litter and duff.
A—0 to 7 inches; loam
Bt1—7 to 14 inches; loam
Bt2 to BCt—14 to 72 inches; clay

Characteristics of Hotaw Loam

Slope: 2 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Fine-loamy colluvium and residuum derived from granodiorite
Observed vegetation: Mixed conifers, hardwoods, shrubs, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Moderate (about 5.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A1 and A2—0 to 12 inches; loam
Bt—12 to 34 inches; sandy clay loam
Cr—34 inches; soft, weathered bedrock

Minor Components in Map Unit 165yu

Chaix and similar soils
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Musick and similar soils
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Surnuf gravelly loam and similar soils
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Altered soils in piles and windrows
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Wet soils and seeps
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Hydric

173yu—Hotaw-Chawanakee-Holland complex, 8 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and wildlife habitat
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,195 to 3,095 feet (365 to 944 meters)
Mean annual precipitation: 50 to 70 inches (1,270 to 1,778 millimeters)

Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 160 to 240 days

Map Unit Composition

Hotaw loam—45 percent
Chawanakee gravelly sandy loam—20 percent
Holland loam—15 percent
Minor components—20 percent

Characteristics of Hotaw Loam

Slope: 8 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Fine-loamy colluvium and residuum weathered from granodiorite
Observed vegetation: Hardwoods, shrubs, and scattered ponderosa pine
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A1 and A2—0 to 12 inches; loam
- Bt—12 to 34 inches; sandy clay loam
- Cr—34 inches; soft, weathered bedrock

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 8 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Coarse-loamy residuum weathered from granodiorite
Observed vegetation: Hardwoods, shrubs, and scattered ponderosa pine
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 1.1 inches)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Characteristics of Holland Loam

Slope: 8 to 30 percent
Geomorphic position: Granitic mountains
Parent material: Fine-loamy colluvium and residuum weathered from granodiorite
Observed vegetation: Ponderosa pine, incense cedar, hardwoods, and shrubs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1 and A2—0 to 15 inches; loam
Bt1 to BCt—15 to 65 inches; clay loam

Minor Components in Map Unit 173yu

Flanly and similar soils
Composition: 5 percent
Slope: 8 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 5 percent
Slope: 8 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Swedesflat and similar soils
Composition: 5 percent

Slope: 8 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are less than 20 inches deep to bedrock
Composition: 5 percent
Slope: 8 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

175—Farwell clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: Western Butte County
Major uses: Row crops, orchard crops, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 170 feet (37 to 53 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Farwell clay loam, rarely flooded—85 percent
Minor components—15 percent

Characteristics of Farwell Clay Loam, Rarely Flooded

Slope: 0 to 2 percent
Geomorphic position: Margins between distal alluvial fans and flood plains
Parent material: Fine-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut and almond orchards and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very high (about 11.7 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 1
- *Land capability, nonirrigated:* 3s-2
- *Storie index:* 75 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Ap—0 to 5 inches; clay loam

ABt—5 to 9 inches; clay loam
Bt1—9 to 18 inches; clay loam
Bt2—18 to 26 inches; clay loam
Bt3—26 to 33 inches; clay loam
2Btb1—33 to 43 inches; clay loam
2Btb2—43 to 57 inches; clay loam
2Btb3—57 to 72 inches; clay loam
3Bwb—72 to 81 inches; loam

Minor Components in Map Unit 175

Gianella fine sandy loam or loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Parrott silt loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Areas with gravel and coarse sand on the surface
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Not hydric

Conejo clay loam or loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

176—Farwell loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Western Butte County
Major uses: Irrigated crops and orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 150 to 170 feet (46 to 53 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Farwell loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Farwell Loam, Occasionally Flooded

Slope: 0 to 2 percent
Geomorphic position: Margins between distal alluvial fans and flood plains

Parent material: Fine-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Dams and levees along the Sacramento River and its tributaries, drainage ditches, and leveling for agriculture have altered the hydrology, modifying the frequency and duration of saturation, ponding, and flooding.
Annual flooding frequency: Occasional
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.6 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2s-2
Land capability, nonirrigated: 3s-2
Storie index: 79 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 6 inches; loam
A1—6 to 20 inches; loam
A2—20 to 36 inches; loam
Btb—36 to 50 inches; clay loam
Bwb—50 to 60 inches; loam

Minor Components in Map Unit 176

Conejo clay loam and similar soils
Composition: 8 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Gianella fine sandy loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Parrott silt loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Soils that have a sandy or gravelly substratum
Composition: 1 percent
Slope: 0 to 2 percent

Geomorphic position: Flood plains
Hydric soil status: Not hydric

Areas that have abandoned channels
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Not hydric

176yu—Jocal loam, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,695 to 4,195 feet (822 to 1,280 meters)
Mean annual precipitation: 50 to 85 inches (1,270 to 2,159 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Jocal loam—80 percent
Minor components—20 percent

Characteristics of Jocal Loam

Slope: 8 to 15 percent
Geomorphic position: Metamorphic mountains
Parent material: Fine-loamy colluvium and residuum weathered from metasedimentary rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 9.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A and Bt1—0 to 8 inches; loam
- Bt2 to Bt6—8 to 73 inches; clay loam

Minor Components in Map Unit 176yu

Mariposa and similar soils
Composition: 10 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Surnuf, high elevation, and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

177—Farwell silt loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Irrigated row crops and orchard crops, nonirrigated grain and hay, livestock grazing, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 120 feet (29 to 37 meters)
Mean annual precipitation: 18 to 21 inches (457 to 533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Farwell silt loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Farwell Silt Loam, Occasionally Flooded

Slope: 0 to 2 percent
Geomorphic position: Margins between flood basins and flood plains
Parent material: Silty and loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Annual grasses and forbs, beans, safflower, almond orchards, prune orchards, walnut orchards, and valley oak
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Dams and levees along the Sacramento River and its tributaries, drainage ditches, and leveling for agriculture have altered the

hydrology, modifying the frequency and duration of saturation, ponding, and flooding.
Annual flooding frequency: Occasional
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 13.3 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2s-2
Land capability, nonirrigated: 3s-2
Storie index: 79 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 6 inches; silt loam
ABt—6 to 11 inches; silty clay loam
Btb1—11 to 22 inches; silt loam
Btb2—22 to 33 inches; silty clay loam
Btb3—33 to 39 inches; silty clay loam
Btb4—39 to 49 inches; silt loam
Btb5—49 to 62 inches; loam and silty clay loam

Minor Components in Map Unit 177

Parrott silt loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Dodgeland silty clay loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Margins between flood basins and flood plains
Hydric soil status: Hydric

Vermet silt loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Codora silty clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Soils that have a sandy substratum
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Areas with gravel and coarse sand on the surface
Composition: 1 percent

Slope: 0 to 1 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

178—Arbuckle gravelly loam, 0 to 2 percent slopes

Map Unit Setting

General location: Western Butte County
Major uses: Livestock grazing, wildlife habitat, homesite development, and source of gravel
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 110 feet (30 to 34 meters)
Mean annual precipitation: 19 to 21 inches (483 to 533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Arbuckle gravelly loam—87 percent
Minor components—13 percent

Characteristics of Arbuckle Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Parent material: Fine-loamy alluvium over gravelly alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Wild oat, Italian ryegrass, yellow starthistle, filaree, ripgut brome, soft chess, mouse barley, vetch, and curly dock
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 9.8 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 2s-4
- *Land capability, nonirrigated:* 3s-4
- *Storie index:* 71 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A1—0 to 4 inches; gravelly loam
- A2—4 to 9 inches; gravelly loam
- Bt1—9 to 20 inches; gravelly loam
- Bt2—20 to 32 inches; loam
- Bt3—32 to 49 inches; gravelly loam

2Bt4—49 to 68 inches; very gravelly sandy clay loam
2Bt5—68 to 86 inches; very gravelly sandy clay loam

Minor Components in Map Unit 178

Moda taxadjunct loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Oroville gravelly fine sandy loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Fernandez sandy loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Arbuckle gravelly sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are 40 to 80 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

179—Moda taxadjunct-Arbuckle complex, 0 to 2 percent slopes

Map Unit Setting

General location: Western Butte County
Major uses: Livestock grazing and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 120 feet (30 to 37 meters)
Mean annual precipitation: 19 to 21 inches (483 to 533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Moda taxadjunct loam—65 percent
Arbuckle gravelly loam—20 percent
Minor components—15 percent

Characteristics of Moda Taxadjunct Loam

Slope: 0 to 2 percent
Geomorphic position: Swales on low terraces

Parent material: Loamy alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Soft chess, medusahead, Italian ryegrass, ripgut brome, purple needlegrass, coyote thistle, goldfields, popcorn flower, filaree, and yellow starthistle
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 3.6 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 14 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 2 inches; loam
A2—2 to 6 inches; loam
Bt1—6 to 13 inches; loam
2Bt2—13 to 22 inches; clay
2Bkqm—22 inches; duripan

Characteristics of Arbuckle Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Mounds on low terraces
Parent material: Fine-loamy alluvium over gravelly alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Wild oat, Italian ryegrass, yellow starthistle, filaree, ripgut brome, soft chess, mouse barley, vetch, and curly dock
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.8 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2s-4
Land capability, nonirrigated: 3s-4
Storie index: 71 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 9 inches; gravelly loam
Bt1—9 to 20 inches; gravelly loam
Bt2—20 to 32 inches; loam
Bt3—32 to 49 inches; gravelly loam
2Bt4—49 to 68 inches; very gravelly sandy clay loam
2Bt5—68 to 86 inches; very gravelly sandy clay loam

Minor Components in Map Unit 179

Dodgeland silty clay loam and similar soils
Composition: 6 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

Farwell silty clay loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Margins between low terraces and flood plains
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on low terraces
Hydric soil status: Hydric

180—Dodgeland silty clay loam, 0 to 5 percent slopes, occasionally flooded

Map Unit Setting

General location: Western Butte County
Major uses: Nonirrigated and irrigated crops, livestock grazing, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 120 feet (29 to 37 meters)
Mean annual precipitation: 18 to 20 inches (457 to 508 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Dodgeland silty clay loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Dodgeland Silty Clay Loam, Occasionally Flooded

Slope: 0 to 5 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, safflower, sunflowers, nonirrigated grain crops, soft chess, and filaree
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 80 to 140 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: High (about 9.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 43 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap1—0 to 4 inches; silty clay loam
Ap2—4 to 8 inches; silty clay
Bss1—8 to 18 inches; silty clay
Bss2—18 to 33 inches; silty clay
Bss3—33 to 45 inches; silty clay
Bkss—45 to 53 inches; silty clay
2Bw1—53 to 60 inches; silty clay loam
2Bw2—60 to 70 inches; silty clay loam
2Bw3—70 to 80 inches; silty clay loam

Minor Components in Map Unit 180

Vermet silty clay loam and similar soils
Composition: 5 percent
Slope: 0 to 5 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Parrott silt loam and similar soils
Composition: 3 percent
Slope: 0 to 5 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Edjobe silty clay and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Dodgeland silt loam or sandy clay loam, overwash, and similar soils
Composition: 3 percent
Slope: 0 to 5 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Farwell silt loam and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Margins of flood plains and flood basins
Hydric soil status: Not hydric

181—Dodgeland silty clay loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Livestock grazing and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 110 feet (29 to 35 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Dodgeland silty clay loam, frequently flooded—80 percent
Minor components—20 percent

Characteristics of Dodgeland Silty Clay Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Fitch spikeweed, Italian ryegrass, filaree, soft chess, and hardstem tule
Surface feature: A few areas have been leveled for agriculture.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 80 to 140 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.

Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: High (about 9.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 43 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap1—0 to 4 inches; silty clay loam
Ap2—4 to 8 inches; silty clay
Bss1—8 to 18 inches; silty clay
Bss2—18 to 33 inches; silty clay
Bss3—33 to 45 inches; silty clay
Bkss—45 to 53 inches; silty clay
2Bw1—53 to 60 inches; silty clay loam
2Bw2—60 to 70 inches; silty clay loam
2Bw3—70 to 80 inches; silty clay loam

Minor Components in Map Unit 181

Vermet and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels along margins of flood plains and flood basins
Hydric soil status: Hydric

Parrott and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Margins of flood plains and flood basins
Hydric soil status: Not hydric

Farwell silt loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Margins of flood plains and flood basins
Hydric soil status: Not hydric

Edjobe and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Areas that have been scoured by flooding
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

188yu—Mariposa taxadjunct gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,195 feet (610 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Mariposa taxadjunct gravelly loam—80 percent
Minor components—20 percent

Characteristics of Mariposa Taxadjunct Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Metamorphic mountains
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 15 to 35 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 2.7 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 4 inches; gravelly loam
- Bt1 to Bt3—4 to 23 inches; gravelly clay loam
- R—23 inches; bedrock

Minor Components in Map Unit 188yu

Rock outcrop
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Jocal and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

189—Esquon silt loam, 0 to 1 percent slopes, overwash

Map Unit Setting

General location: Southwestern Butte County
Major uses: Irrigated cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 75 feet (21 to 24 meters)
Mean annual precipitation: 19 inches (483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Esquon silt loam, overwash—90 percent
Minor components—10 percent

Characteristics of Esquon Silt Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: Overwash originating from the Cherokee Gold Mine occurs as layers of silt loam and very fine loamy sand that buried the natural surface layer of clay. The surface has been laser-leveled for rice production.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 60 inches
Available water capacity: High (about 9.8 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 49 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap1—0 to 4 inches; silt loam
Ap2—4 to 9 inches; silt loam
C—9 to 15 inches; stratified very fine sandy loam to silt loam
Bssb1—15 to 35 inches; silty clay
Bssb2—35 to 48 inches; silty clay
Bkb—48 to 60 inches; silty clay loam
2Bkqmb—60 inches; duripan

Minor Components in Map Unit 189

Neerdobe silt loam, overwash, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are less than 40 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that have overwash as much as 30 inches thick
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

189yu—Mariposa taxadjunct gravelly loam, 30 to 50 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,195 feet (610 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Mariposa taxadjunct gravelly loam—80 percent
Minor components—20 percent

Characteristics of Mariposa Taxadjunct Gravelly Loam

Slope: 30 to 50 percent

Geomorphic position: Metamorphic mountains
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 15 to 35 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 4 inches; gravelly loam
Bt1 to Bt3—4 to 23 inches; gravelly clay loam
R—23 inches; bedrock

Minor Components in Map Unit 189yu

Rock outcrop
Composition: 10 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

196yu—Mildred cobbly loam, 30 to 50 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,495 to 3,240 feet (457 to 988 meters)
Mean annual precipitation: 35 to 62 inches (889 to 1,574 millimeters)

Mean annual air temperature: 55 to 59 degrees F (13 to 15 degrees C)
Frost-free period: 190 to 230 days

Map Unit Composition

Mildred cobbly loam—80 percent
Minor components—20 percent

Characteristics of Mildred Cobbly Loam

Slope: 30 to 50 percent
Geomorphic position: Mountains
Parent material: Clayey colluvium and residuum weathered from intrusive igneous rocks
Observed vegetation: Interior live oak, MacNab cypress, brush, grasses, and scattered black oak and ponderosa pine
Texture of the surface layer: Cobbly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7e-1
- *Land capability, nonirrigated:* 7e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 3 inches; cobbly loam
- Bt—3 to 9 inches; cobbly clay loam
- 2Bt and 2BCt—9 to 23 inches; clay
- 2Cr—23 inches; bedrock

Minor Components in Map Unit 196yu

Surnuf and similar soils
Composition: 10 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Flanly and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Fine textured soils that are 10 to 20 or 40 to 60 inches deep
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

200—Parrott silt loam, 0 to 2 percent slopes, occasionally flooded

Map Unit Setting

General location: Western Butte County
Major uses: Orchard crops, nonirrigated crops, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 155 feet (30 to 48 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Parrott silt loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Parrott Silt Loam, Occasionally Flooded

Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Parent material: Silty alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut and almond orchards, safflower, wheat, valley oak, cottonwood, California wild grape, Pacific poison oak, blue elderberry, coyote brush, and creeping wildrye
Surface features: Most areas have been leveled for agriculture. Natural bar-and-channel topography remains in some areas.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Dams and levees along the Sacramento River and its tributaries, drainage ditches, and leveling for agriculture have altered the hydrology, modifying the frequency and duration of saturation, ponding, and flooding. During exceptionally wet winters, the water table may be as high as 8 to 30 inches from December through March.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Occasional
- *Depth to a water table (zone of saturation):* 60 to 89 inches
- *Available water capacity:* Very high (about 11.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 3w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 83 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A1—0 to 2 inches; silt loam
- A2—2 to 8 inches; silt loam

Bw1—8 to 20 inches; silt loam
Bw2—20 to 37 inches; silt loam
Bw3—37 to 49 inches; silt loam
Bw4—49 to 63 inches; silt loam
C—63 to 89 inches; silt loam

Minor Components in Map Unit 200

Gianella fine sandy loam or loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Kusalslough silty clay loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Margins between alluvial fans and flood plains
Hydric soil status: Not hydric

Vermet silt loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans adjacent to flood plains
Hydric soil status: Not hydric

Soils that have stratified textures
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Filled channels on flood plains
Hydric soil status: Hydric

201—Parrott silt loam, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Orchard crops, nonirrigated crops, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 170 feet (27 to 52 meters)
Mean annual precipitation: 18 to 23 inches (457 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Parrott silt loam, frequently flooded—85 percent
Minor components—15 percent

Characteristics of Parrott Silt Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Parent material: Silty alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Walnut and almond orchards, safflower, wheat, valley oak, cottonwood, California wild grape, Pacific poison oak, blue elderberry, coyote brush, and creeping wildrye
Surface features: Most areas have been leveled for agriculture. Natural bar-and-channel topography remains in some areas.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding. During exceptionally wet winters, the water table may be as high as 8 to 30 inches from December through March.
Annual flooding frequency: Frequent
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 60 to 89 inches
Available water capacity: Very high (about 11.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4w-2
Land capability, nonirrigated: 4w-2
Storie index: 65 (revised)
Hydric soil status: Hydric
Hydrologic soil group: B

Typical profile
A1—0 to 2 inches; silt loam
A2—2 to 8 inches; silt loam
Bw1—8 to 20 inches; silt loam
Bw2—20 to 37 inches; silt loam
Bw3—37 to 49 inches; silt loam
Bw4—49 to 63 inches; silt loam
C—63 to 89 inches; silt loam

Minor Components in Map Unit 201

Gianella fine sandy loam or loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Hydric

Kusalslough silty clay loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent

Geomorphic position: Margins of flood basins, alluvial fans, and flood plains
Hydric soil status: Hydric

Soils that formed in stratified fill
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Abandoned channels on flood plains
Hydric soil status: Hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

203—Kusalslough silty clay loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Northwestern Butte County
Major uses: Orchard crops and row crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 140 feet (37 to 43 meters)
Mean annual precipitation: 21 to 22 inches (533 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Kusalslough silty clay loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Kusalslough Silty Clay Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood plains
Parent material: Silty alluvium over clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards and row crops
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 14 to 72 inches
Available water capacity: Very high (about 10.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2

Storie index: 62 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 4 inches; silty clay loam
Ap2—4 to 12 inches; silty clay loam
Bw—12 to 21 inches; silty clay loam
Ab—21 to 31 inches; silty clay loam
Bwb1—31 to 41 inches; silty clay loam
Bwb2—41 to 57 inches; silty clay
Bwb3—57 to 69 inches; silty clay
Bwb4—69 to 80 inches; silty clay

Minor Components in Map Unit 203

Bosquejo silt loam, overwash, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Bosquejo clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

Busacca clay loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Parrott silt loam, occasionally flooded, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

205—Parrott-Vermet complex, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 140 feet (26 to 44 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Parrott silt loam, frequently flooded—50 percent

Vermet silt loam, frequently flooded—35 percent
Minor components—15 percent

Characteristics of Parrott Silt Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Parent material: Silty alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Valley oak, cottonwood, California wild grape, Pacific poison oak, blue elderberry, coyote brush, and creeping wildrye
Surface features: Most areas have been leveled for agriculture. Natural bar-and-channel topography remains in some areas.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding. During exceptionally wet winters, the water table may be as high as 8 to 30 inches from December through March.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Occasional
- *Depth to a water table (zone of saturation):* 60 to 89 inches
- *Available water capacity:* Very high (about 11.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 65 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* B

Typical profile
- A1—0 to 2 inches; silt loam
- A2—2 to 8 inches; silt loam
- Bw1—8 to 20 inches; silt loam
- Bw2—20 to 37 inches; silt loam
- Bw3—37 to 49 inches; silt loam
- Bw4—49 to 63 inches; silt loam
- C—63 to 89 inches; silt loam

Characteristics of Vermet Silt Loam, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Channels on flood plains
Parent material: Silty alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Valley oak, cottonwood, California wild grape, Pacific poison oak, blue elderberry, coyote brush, and creeping wildrye
Surface features: The surface has been leveled for agriculture. Natural bar-and-channel topography remains in some areas.

Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: 0 to 20 percent fine, well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding. During exceptionally wet winters, the water table may be as high as 8 to 30 inches from December through March.
Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: Very high (about 11.6 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 34 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 2 inches; silt loam
A2—2 to 8 inches; silt loam
A3—8 to 13 inches; silt loam
Bw1—13 to 16 inches; silty clay loam
Bw2—16 to 26 inches; silty clay loam
Bw3—26 to 41 inches; silty clay loam
Bw4—41 to 62 inches; silty clay loam
Bw5—62 to 72 inches; silty clay loam

Minor Components in Map Unit 205

Columbia sand and similar soils
Composition: 8 percent
Slope: 0 to 2 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Riverwash
Composition: 7 percent
Slope: 0 to 2 percent
Geomorphic position: Gravel bars in channels
Hydric soil status: Hydric

206—Islandbar-Chawanakee complex, 3 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County

Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,400 to 2,795 feet (732 to 853 meters)
Mean annual precipitation: 50 to 60 inches (1,270 to 1,524 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 190 to 235 days

Map Unit Composition

Islandbar sandy loam—60 percent
Chawanakee gravelly sandy loam—30 percent
Minor components—10 percent

Characteristics of Islandbar Sandy Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite or trondhjemite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; sandy loam
A2—5 to 9 inches; sandy loam
Bw1—9 to 27 inches; sandy loam
Bw2—27 to 36 inches; sandy loam
Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite or trondhjemite
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, incense

cedar, sugar pine, California black oak, Douglas-fir, deerbrush, and California buckthorn
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Minor Components in Map Unit 206

Rock outcrop
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Featherfalls sandy loam and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

207—Islandbar-Chawanakee complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,200 to 3,040 feet (671 to 927 meters)
Mean annual precipitation: 50 to 65 inches (1,270 to 1,651 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 190 to 235 days

Map Unit Composition

Islandbar sandy loam—60 percent
Chawanakee gravelly sandy loam—30 percent
Minor components—10 percent

Characteristics of Islandbar Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Parent material: Coarse-loamy residuum and colluvium derived from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.7 inches)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A1—2 to 5 inches; sandy loam
- A2—5 to 9 inches; sandy loam
- Bw1—9 to 27 inches; sandy loam
- Bw2—27 to 36 inches; sandy loam
- Bw3—36 to 47 inches; sandy loam

Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Parent material: Coarse-loamy residuum and colluvium weathered from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, incense cedar, sugar pine, California black oak, Douglas-fir, deerbrush, and California buckthorn
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Minor Components in Map Unit 207

Rock outcrop
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent

Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Hydric soil status: Not hydric

Featherfalls sandy loam and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Hydric soil status: Not hydric

208—Islandbar-Chawanakee complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,115 to 2,765 feet (646 to 844 meters)
Mean annual precipitation: 50 to 65 inches (1,270 to 1,651 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 190 to 235 days

Map Unit Composition

Islandbar sandy loam—60 percent
Chawanakee gravelly sandy loam—30 percent
Minor components—10 percent

Characteristics of Islandbar Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Featherfalls sandy loam and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

209—Islandbar-Chawanakee complex, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,715 to 2,000 feet (524 to 610 meters)
Mean annual precipitation: 55 to 60 inches (1,397 to 1,524 millimeters)
Mean annual air temperature: 57 degrees F (14 degrees C)
Frost-free period: 220 days

Map Unit Composition

Islandbar sandy loam—60 percent
Chawanakee gravelly sandy loam—30 percent
Minor components—10 percent

Characteristics of Islandbar Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from trondhjemite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; sandy loam
A2—5 to 9 inches; sandy loam
Bw1—9 to 27 inches; sandy loam
Bw2—27 to 36 inches; sandy loam
Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, incense cedar, sugar pine, California black oak, Douglas-fir, deerbrush, and California buckthorn
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Geomorphic position: Backslopes on granitic mountains
Hydric soil status: Not hydric

Featherfalls sandy loam and similar soils
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on granitic mountains
Hydric soil status: Not hydric

210—Featherfalls-Islandbar complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, watershed, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 2,995 feet (610 to 914 meters)
Mean annual precipitation: 50 to 60 inches (1,270 to 1,524 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 180 to 235 days

Map Unit Composition

Featherfalls sandy loam—50 percent
Islandbar sandy loam—35 percent
Minor components—15 percent

Characteristics of Featherfalls Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Douglas-fir, ponderosa pine, California black oak, incense cedar, Pacific madrone, tanoak, Pacific poison oak, California honeysuckle, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 25 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; sandy loam
A2—4 to 7 inches; sandy loam
Bt1—7 to 17 inches; sandy clay loam
Bt2—17 to 24 inches; sandy clay loam
Bt3—24 to 32 inches; sandy clay loam
Bt4—32 to 42 inches; sandy clay loam
BCt1—42 to 61 inches; paracobbly sandy clay loam
BCt2—61 to 72 inches; paracobbly sandy clay loam
Crt—72 to 80 inches; very paragravelly sandy clay loam

Characteristics of Islandbar Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; sandy loam
A2—5 to 9 inches; sandy loam
Bw1—9 to 27 inches; sandy loam

Bw2—27 to 36 inches; sandy loam
Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Minor Components in Map Unit 210

Fine-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

Haploxerults, fine-loamy, more than 35 percent clay in the subsoil, and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are underlain by paralithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

211—Featherfalls-Islandbar complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, watershed, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,175 feet (610 to 968 meters)
Mean annual precipitation: 50 to 65 inches (1,270 to 1,651 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 180 to 235 days

Map Unit Composition

Featherfalls sandy loam—50 percent
Islandbar sandy loam—35 percent
Minor components—15 percent

Characteristics of Featherfalls Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium derived from trondhjemite or quartz diorite
Observed vegetation: Douglas-fir, ponderosa pine, California black oak, incense cedar, Pacific madrone, tanoak, Pacific poison oak, California honeysuckle, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 25 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; sandy loam
A2—4 to 7 inches; sandy loam
Bt1—7 to 17 inches; sandy clay loam
Bt2—17 to 24 inches; sandy clay loam
Bt3—24 to 32 inches; sandy clay loam

Bw1—9 to 27 inches; sandy loam
Bw2—27 to 36 inches; sandy loam
Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Minor Components in Map Unit 211

Fine-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haploxerults, fine-loamy, more than 35 percent clay in the subsoil, and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are underlain by paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

212—Featherfalls-Islandbar complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,840 to 2,995 feet (561 to 914 meters)
Mean annual precipitation: 50 to 65 inches (1,270 to 1,651 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 170 to 235 days

Map Unit Composition

Featherfalls sandy loam—50 percent
Islandbar sandy loam—35 percent
Minor components—15 percent

Characteristics of Featherfalls Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Douglas-fir, ponderosa pine, California black oak, incense cedar, Pacific madrone, tanoak, Pacific poison oak, California honeysuckle, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 25 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; sandy loam
A2—4 to 7 inches; sandy loam
Bt1—7 to 17 inches; sandy clay loam
Bt2—17 to 24 inches; sandy clay loam
Bt3—24 to 32 inches; sandy clay loam
Bt4—32 to 42 inches; sandy clay loam
BCt1—42 to 61 inches; paracobbly sandy clay loam

BCt2—61 to 72 inches; paracobbly sandy clay loam
Crt—72 to 80 inches; very paragravelly sandy clay loam

Characteristics of Islandbar Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; sandy loam
A2—5 to 9 inches; sandy loam
Bw1—9 to 27 inches; sandy loam
Bw2—27 to 36 inches; sandy loam
Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Minor Components in Map Unit 212

Fine-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haploxerults, fine-loamy, more than 35 percent clay in the subsoil, and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are underlain by paralithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

213—Featherfalls-Islandbar complex, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 3,020 feet (274 to 922 meters)
Mean annual precipitation: 50 to 65 inches (1,270 to 1,651 millimeters)
Mean annual air temperature: 54 to 57 degrees F (12 to 14 degrees C)
Frost-free period: 170 to 235 days

Map Unit Composition

Featherfalls sandy loam—45 percent
Islandbar sandy loam—35 percent
Minor components—20 percent

Characteristics of Featherfalls Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Douglas-fir, ponderosa pine, California black oak, incense cedar, Pacific madrone, tanoak, Pacific poison oak, California honeysuckle, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 25 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: High (about 8.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; sandy loam
A2—4 to 7 inches; sandy loam
Bt1—7 to 17 inches; sandy clay loam
Bt2—17 to 24 inches; sandy clay loam
Bt3—24 to 32 inches; sandy clay loam
Bt4—32 to 42 inches; sandy clay loam
BCt1—42 to 61 inches; paracobbly sandy clay loam
BCt2—61 to 72 inches; paracobbly sandy clay loam
Crt—72 to 80 inches; very paragravelly sandy clay loam

Characteristics of Islandbar Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite or quartz diorite
Observed vegetation: Ponderosa pine, incense cedar, canyon live oak, tanoak, Douglas-fir, California black oak, Pacific poison oak, whiteleaf manzanita, deerbrush, and toyon
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; sandy loam
A2—5 to 9 inches; sandy loam
Bw1—9 to 27 inches; sandy loam
Bw2—27 to 36 inches; sandy loam

Bw3—36 to 47 inches; sandy loam
Bw4—47 to 58 inches; sandy loam
C1—58 to 62 inches; loamy sand
C2—62 to 72 inches; extremely gravelly loamy sand

Minor Components in Map Unit 213

Chawanakee and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are underlain by paralithic bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haploxerults, fine-loamy, more than 35 percent clay in the subsoil, and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

214—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 2 to 15 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, homesite development, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 895 to 2,595 feet (274 to 792 meters)
Mean annual precipitation: 40 to 55 inches (1,016 to 1,397 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Crystalhill gravelly coarse sandy loam—35 percent
Oregongulch gravelly sandy loam—20 percent
Craigsaddle coarse sandy loam—20 percent

Rock outcrop—10 percent
Minor components—15 percent

Characteristics of Crystalhill Gravelly Coarse Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 7 inches; gravelly coarse sandy loam
Bw1—7 to 14 inches; gravelly coarse sandy loam
Bw2—14 to 22 inches; gravelly coarse sandy loam
Bw3—22 to 33 inches; gravelly sandy loam
Bw4—33 to 44 inches; gravelly sandy loam
BC—44 to 66 inches; sandy loam
Cdt—66 inches; bedrock

Characteristics of Oregongulch Gravelly Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent medium, angular gravel
Depth to a restrictive feature (densic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly sandy loam
Bw1—4 to 7 inches; gravelly sandy loam
Bw2—7 to 13 inches; gravelly sandy loam
Bw3—13 to 18 inches; gravelly sandy loam
C—18 to 24 inches; very gravelly sandy loam
Cdt—24 to 60 inches; bedrock

Characteristics of Craigsaddle Coarse Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Coarse sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; coarse sandy loam
Bw1—5 to 11 inches; sandy loam
Bw2—11 to 17 inches; sandy loam
Bw3—17 to 21 inches; sandy loam
Bt1—21 to 31 inches; sandy loam
Bt2—31 to 51 inches; sandy loam
BCt—51 to 58 inches; gravelly sandy loam
Cdt—58 to 80 inches; bedrock

Characteristics of Rock Outcrop

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 214

Stony or bouldery soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Hydric soil status: Not hydric

Aquic Haploxerepts, coarse-loamy, and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Drainageways on granitic hills
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Hydric soil status: Not hydric

Alluvial soils in riparian areas
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Drainageways on granitic hills
Hydric soil status: Not hydric

Lamellic Haploxerepts with densic bedrock at a depth of 40 to 60 inches and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Hydric soil status: Not hydric

Soils that are more than 60 inches deep to densic bedrock
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on granitic hills
Hydric soil status: Not hydric

215—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 15 to 30 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, homesite development, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 895 to 2,000 feet (274 to 610 meters)
Mean annual precipitation: 40 to 55 inches (1,016 to 1,397 millimeters)

Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Crystalhill gravelly coarse sandy loam—35 percent
Oregongulch gravelly sandy loam—20 percent
Craigsaddle coarse sandy loam—20 percent
Rock outcrop—10 percent
Minor components—15 percent

Characteristics of Crystalhill Gravelly Coarse Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 7 inches; gravelly coarse sandy loam
Bw1—7 to 14 inches; gravelly coarse sandy loam
Bw2—14 to 22 inches; gravelly coarse sandy loam
Bw3—22 to 33 inches; gravelly sandy loam
Bw4—33 to 44 inches; gravelly sandy loam
BC—44 to 66 inches; sandy loam
Cdt—66 inches; bedrock

Characteristics of Oregongulch Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 5 to 40 percent medium, angular gravel
Depth to a restrictive feature (densic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly sandy loam
Bw1—4 to 7 inches; gravelly sandy loam
Bw2—7 to 13 inches; gravelly sandy loam
Bw3—13 to 18 inches; gravelly sandy loam
C—18 to 24 inches; very gravelly sandy loam
Cdt—24 to 60 inches; bedrock

Characteristics of Craigsaddle Coarse Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Coarse sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; coarse sandy loam

Bw1—5 to 11 inches; sandy loam
Bw2—11 to 17 inches; sandy loam
Bw3—17 to 21 inches; sandy loam
Bt1—21 to 31 inches; sandy loam
Bt2—31 to 51 inches; sandy loam
BCt—51 to 58 inches; gravelly sandy loam
Cdt—58 to 80 inches; bedrock

Characteristics of Rock Outcrop

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 215

Haploxeralfs, fine, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Lamellic Haploxerepts, coarse-loamy, more than 60 inches deep to densic bedrock, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to densic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

216—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 895 to 2,000 feet (274 to 610 meters)
Mean annual precipitation: 40 to 55 inches (1,016 to 1,397 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Crystalhill gravelly coarse sandy loam—35 percent
Oregongulch gravelly sandy loam—20 percent
Craigsaddle coarse sandy loam—20 percent
Rock outcrop—10 percent
Minor components—15 percent

Characteristics of Crystalhill Gravelly Coarse Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 7 inches; gravelly coarse sandy loam
Bw1—7 to 14 inches; gravelly coarse sandy loam
Bw2—14 to 22 inches; gravelly coarse sandy loam
Bw3—22 to 33 inches; gravelly sandy loam
Bw4—33 to 44 inches; gravelly sandy loam
BC—44 to 66 inches; sandy loam
Cdt—66 inches; bedrock

Characteristics of Oregongulch Gravelly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent medium, angular gravel

Depth to a restrictive feature (densic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly sandy loam
Bw1—4 to 7 inches; gravelly sandy loam
Bw2—7 to 13 inches; gravelly sandy loam
Bw3—13 to 18 inches; gravelly sandy loam
C—18 to 24 inches; very gravelly sandy loam
Cdt—24 to 60 inches; bedrock

Characteristics of Craigsaddle Coarse Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Fine-loamy colluvium and residuum weathered from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Coarse sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; coarse sandy loam
Bw1—5 to 11 inches; sandy loam
Bw2—11 to 17 inches; sandy loam

Bw3—17 to 21 inches; sandy loam
Bt1—21 to 31 inches; sandy loam
Bt2—31 to 51 inches; sandy loam
BCt—51 to 58 inches; gravelly sandy loam
Cdt—58 to 80 inches; bedrock

Characteristics of Rock Outcrop

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 216

Haploxeralfs, fine, and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Lamellic Haploxerepts, coarse-loamy, more than 60 inches deep to densic bedrock, and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are more than 60 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

217—Crystalhill-Oregongulch-Craigsaddle-Rock outcrop complex, 50 to 70 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 55 inches (1,016 to 1,397 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Crystalhill gravelly coarse sandy loam—35 percent
Oregongulch gravelly sandy loam—20 percent

Craigsaddle coarse sandy loam—20 percent
Rock outcrop—10 percent
Minor components—15 percent

Characteristics of Crystalhill Gravelly Coarse Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium derived from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 7 inches; gravelly coarse sandy loam
Bw1—7 to 14 inches; gravelly coarse sandy loam
Bw2—14 to 22 inches; gravelly coarse sandy loam
Bw3—22 to 33 inches; gravelly sandy loam
Bw4—33 to 44 inches; gravelly sandy loam
BC—44 to 66 inches; sandy loam
Cdt—66 inches; bedrock

Characteristics of Oregongulch Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Coarse-loamy colluvium derived from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent medium, angular gravel
Depth to a restrictive feature (densic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly sandy loam
Bw1—4 to 7 inches; gravelly sandy loam
Bw2—7 to 13 inches; gravelly sandy loam
Bw3—13 to 18 inches; gravelly sandy loam
C—18 to 24 inches; very gravelly sandy loam
Cdt—24 to 60 inches; bedrock

Characteristics of Craigsaddle Coarse Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Fine-loamy colluvium derived from trondhjemite
Observed vegetation: Live oak, California black oak, whiteleaf manzanita, toyon, buckbrush, foothill pine, Pacific poison oak, deerbrush, Pacific madrone, scrub oak, and scattered ponderosa pine and incense cedar; Douglas-fir in draws
Texture of the surface layer: Coarse sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel
Depth to a restrictive feature (densic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; coarse sandy loam
Bw1—5 to 11 inches; sandy loam
Bw2—11 to 17 inches; sandy loam
Bw3—17 to 21 inches; sandy loam
Bt1—21 to 31 inches; sandy loam
Bt2—31 to 51 inches; sandy loam
BCt—51 to 58 inches; gravelly sandy loam
Cdt—58 to 80 inches; bedrock

Characteristics of Rock Outcrop

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 217

Haploxeralfs, fine, and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Lamellic Haploxerepts, coarse-loamy, more than 60 inches deep to densic bedrock, and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are less than 20 inches deep to densic bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

218—Rock outcrop-Lithic Xerorthents-Chawanakee complex, 12 to 50 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,115 to 2,915 feet (646 to 890 meters)
Mean annual precipitation: 50 to 60 inches (1,270 to 1,524 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 200 to 240 days

Map Unit Composition

Rock outcrop (quartz diorite)—60 percent
Lithic Xerorthents gravelly sandy loam, mesic—20 percent

Chawanakee gravelly sandy loam—15 percent
Minor components—5 percent

Characteristics of Rock Outcrop (Quartz Diorite)

Slope: 12 to 50 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Lithic Xerorthents Gravelly Sandy Loam, Mesic

Slope: 12 to 50 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from intrusive igneous rocks
Observed vegetation: Canyon live oak, whiteleaf manzanita, California black oak, and scattered conifers
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 50 percent coarse, subrounded gravel, 0 to 30 percent subrounded cobbles, 0 to 50 percent subrounded stones, 0 to 50 percent subrounded boulders
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 0.6 inch)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 8
- *Land capability, nonirrigated:* 8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 4 inches; gravelly sandy loam
- Bw—4 to 8 inches; sandy loam
- R—8 inches; bedrock

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 12 to 50 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and residuum weathered from intrusive igneous rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, incense cedar, sugar pine, California black oak, Douglas-fir, deerbrush, and California buckthorn
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
*Depth to a restrictive feature (paralithic bedrock):*10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Minor Components in Map Unit 218

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 12 to 50 percent
Geomorphic position: Ridgetops and side slopes on granitic mountains
Hydric soil status: Not hydric

219—Rock outcrop-Lithic Xerorthents-Chawanakee complex, 50 to 70 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,555 to 4,395 feet (780 to 1,341 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 110 to 240 days

Map Unit Composition

Rock outcrop (quartz diorite)—60 percent
Lithic Xerorthents gravelly sandy loam, mesic—20 percent
Chawanakee gravelly sandy loam—15 percent
Minor components—5 percent

Characteristics of Rock Outcrop (Quartz Diorite)

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Lithic Xerorthents Gravelly Sandy Loam, Mesic

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from intrusive igneous rocks
Observed vegetation: Canyon live oak, whiteleaf manzanita, California black oak, and scattered conifers
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 50 percent coarse, subrounded gravel, 0 to 30 percent subrounded cobbles, 0 to 50 percent subrounded stones, 0 to 50 percent subrounded boulders
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.6 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; gravelly sandy loam
Bw—4 to 8 inches; sandy loam
R—8 inches; bedrock

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from intrusive igneous rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, incense cedar, sugar pine, California black oak, Douglas-fir, deerbrush, and California buckthorn
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8

Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Minor Components in Map Unit 219

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

220—Esquon-Clear Lake complex, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 70 feet (18 to 22 meters)
Mean annual precipitation: 18 inches (457 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Esquon clay, frequently flooded—60 percent
Clear Lake silty clay loam, overwash—30 percent
Minor components—10 percent

Characteristics of Esquon Clay, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Tules, swamp timothy, smartweed, sourdock, spike rush, bulrush, arnica ssp., bermudagrass, and cattails
Surface features: The surface has been leveled for agriculture. Surface polygonal cracking occurs during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural

depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 60 inches
Available water capacity: High (about 7.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 24 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 10 inches; clay
Bkss1—10 to 22 inches; clay
Bkss2—22 to 40 inches; clay
Bk—40 to 50 inches; clay loam
2Bkqm—50 inches; duripan

Characteristics of Clear Lake Silty Clay Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Flood-deposited, silty alluvium over silty and clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Tules, swamp timothy, smartweed, sourdock, spike rush, bulrush, arnica ssp., bermudagrass, and cattails
Surface feature: The surface layer of silty clay loam is flood-deposited overwash.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: High (about 9.6 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 31 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 0.5 inch; silty clay loam
Ab—0.5 inch to 7 inches; clay
Bgb1—7 to 19 inches; clay
Bgb2—19 to 29 inches; clay
Bkssb1—29 to 40 inches; clay
Bkssb2—40 to 55 inches; clay
Bkssb3—55 to 80 inches; clay

Minor Components in Map Unit 220

Clear Lake clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon soils with a duripan at a depth of more than 60 inches and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are continuously saturated
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

221yu—Sites loam, 3 to 8 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production, livestock grazing, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,995 to 4,195 feet (609 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 130 to 190 days

Map Unit Composition

Sites loam—85 percent
Minor components—15 percent

Characteristics of Sites Loam

Slope: 3 to 8 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 6 inches; loam
Bt1—6 to 16 inches; clay loam
Bt2 to Bt4—16 to 51 inches; clay
Bt5—51 to 61 inches; clay loam
Cr—61 inches; bedrock

Minor Components in Map Unit 221yu

Mariposa and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites gravelly loam and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Rogerville silt loam and similar soils
Composition: 3 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Soils that are wet
Composition: 2 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Hydric

222yu—Sites loam, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production, livestock grazing, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,995 to 4,195 feet (609 to 1,280 meters)
Mean annual precipitation: 50 to 85 inches (1,270 to 2,159 millimeters)

Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 130 to 190 days

Map Unit Composition

Sites loam—85 percent
Minor components—15 percent

Characteristics of Sites Loam

Slope: 8 to 15 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 9.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 6 inches; loam
- Bt1—6 to 16 inches; clay loam
- Bt2 to Bt4—16 to 51 inches; clay
- Bt5—51 to 61 inches; clay loam
- Cr—61 inches; bedrock

Minor Components in Map Unit 222yu

Mariposa and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites gravelly loam, bedrock substratum, and similar soils
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Soils that are wet
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Hydric

Powellton and similar soils
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

225yu—Sites gravelly loam, bedrock substratum, 3 to 8 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production, livestock grazing, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,195 feet (610 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 130 to 190 days

Map Unit Composition

Sites gravelly loam, bedrock substratum—80 percent
Minor components—20 percent

Characteristics of Sites Gravelly Loam, Bedrock Substratum

Slope: 3 to 8 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very high (about 15.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 2e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 5 inches; gravelly loam

Bt1 to Bt5—5 to 53 inches; gravelly clay loam and gravelly clay
Cr—53 inches; bedrock

Minor Components in Map Unit 225yu

Mariposa and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Very deep Sites and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

226yu—Sites gravelly loam, bedrock substratum, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,195 feet (610 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 130 to 190 days

Map Unit Composition

Sites gravelly loam, bedrock substratum—80 percent
Minor components—20 percent

Characteristics of Sites Gravelly Loam, Bedrock Substratum

Slope: 8 to 15 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 15.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 5 inches; gravelly loam
Bt1 to Bt5—5 to 53 inches; gravelly clay and gravelly clay loam
Cr—53 inches; bedrock

Minor Components in Map Unit 226yu

Mariposa and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Woodleaf and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Very deep Sites and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

227yu—Sites gravelly loam, bedrock substratum, 15 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and homesite development

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,195 feet (610 to 1,280 meters)
Mean annual precipitation: 50 to 80 inches (1,270 to 2,032 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 130 to 190 days

Map Unit Composition

Sites gravelly loam, bedrock substratum—80 percent
Minor components—20 percent

Characteristics of Sites Gravelly Loam, Bedrock Substratum

Slope: 15 to 30 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very high (about 15.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 5 inches; gravelly loam
- Bt1 to Bt5—5 to 53 inches; gravelly clay and gravelly clay loam
- Cr—53 inches; bedrock

Minor Components in Map Unit 227yu

Mariposa and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Woodleaf and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 4 percent
Slope: 15 to 30 percent

Geomorphic position: Mountains
Hydric soil status: Not hydric

Very deep Sites and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

242yu—Surnuf gravelly loam, 8 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production, livestock grazing, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,400 to 3,320 feet (427 to 1,012 meters)
Mean annual precipitation: 35 to 66 inches (889 to 1,676 millimeters)
Mean annual air temperature: 54 to 59 degrees F (12 to 15 degrees C)
Frost-free period: 170 to 240 days

Map Unit Composition

Surnuf loam—80 percent
Minor components—20 percent

Characteristics of Surnuf Loam

Slope: 8 to 15 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey colluvium and residuum weathered from gabbrodiorite
Observed vegetation: Ponderosa pine, incense cedar, California black oak, and brush
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 12 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 2.0 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
A and BAt—0 to 12 inches; loam
Bt1 to BCt—12 to 77 inches; clay loam and clay

Minor Components in Map Unit 242yu

Mildred and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sommeyflat and similar soils
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Clayey soils that are 40 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 8 to 15 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

243yu—Surnuf gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production, livestock grazing, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,400 to 3,320 feet (427 to 1,012 meters)
Mean annual precipitation: 35 to 66 inches (889 to 1,676 millimeters)
Mean annual air temperature: 54 to 59 degrees F (12 to 15 degrees C)
Frost-free period: 170 to 240 days

Map Unit Composition

Surnuf loam—80 percent
Minor components—20 percent

Characteristics of Surnuf Loam

Slope: 15 to 30 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey colluvium and residuum weathered from gabbrodiorite

Observed vegetation: Ponderosa pine, incense cedar, California black oak, and brush
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 12 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A and BAt—0 to 12 inches; loam
Bt1 to BCt—12 to 77 inches; clay and clay loam

Minor Components in Map Unit 243yu

Mildred and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sommeyflat and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Clayey soils that are 40 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

244yu—Surnuf gravelly loam, 30 to 50 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,400 to 3,320 feet (427 to 1,012 meters)
Mean annual precipitation: 35 to 66 inches (889 to 1,676 millimeters)
Mean annual air temperature: 54 to 59 degrees F (12 to 15 degrees C)
Frost-free period: 170 to 240 days

Map Unit Composition

Surnuf loam—80 percent
Minor components—20 percent

Characteristics of Surnuf Loam

Slope: 30 to 50 percent
Geomorphic position: Metamorphic mountains
Parent material: Clayey colluvium and residuum weathered from gabbrodiorite
Observed vegetation: Ponderosa pine, incense cedar, California black oak, and brush
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 12 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 2.0 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A and BAt—0 to 12 inches; loam
- Bt1 to BCt—12 to 77 inches; clay loam and clay

Minor Components in Map Unit 244yu

Mildred and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Sommeyflat and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

Clayey soils that are 40 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Mountains
Hydric soil status: Not hydric

245—Surnuf gravelly loam, 50 to 70 percent slopes

Map Unit Setting

General location: Southeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,245 to 2,795 feet (381 to 853 meters)
Mean annual precipitation: 60 to 65 inches (1,524 to 1,651 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 190 days

Map Unit Composition

Surnuf loam—80 percent
Minor components—20 percent

Characteristics of Surnuf Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes in canyons on metamorphic mountains
Parent material: Clayey colluvium derived from gabbrodiorite
Observed vegetation: Ponderosa pine, incense cedar, California black oak, Douglas-fir, whiteleaf manzanita, Pacific madrone, and Pacific poison oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 12 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1

Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A and BAt—0 to 12 inches; loam
Bt1 to BCt—12 to 77 inches; clay and clay loam

Minor Components in Map Unit 245

Sites and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes in canyons on metamorphic mountains
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes in canyons on metamorphic mountains
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes in canyons on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes in canyons on metamorphic mountains
Hydric soil status: Not hydric

248yu—Trainer loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 25 to 110 feet (9 to 35 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 290 days

Map Unit Composition

Trainer loam—85 percent
Minor components—15 percent

Characteristics of Trainer Loam

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Mixed fine-loamy alluvium

Observed vegetation: Rice, grasses, forbs, scattered valley oak, cottonwood, and shrubs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 36 to 60 inches
Available water capacity: Very high (about 10.2 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2
Storie index: 48.0 (historical number)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 4 inches; loam
A—4 to 9 inches; loam
Bt1—9 to 16 inches; loam
Bt2—16 to 23 inches; loam
Bt3—23 to 36 inches; sandy loam
BCt—36 to 48 inches; sandy loam
C1—48 to 59 inches; sandy loam
C2—59 to 66 inches; coarse sandy loam

Minor Components in Map Unit 248yu

Columbia and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Kimball and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

San Joaquin and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that have a water table within a depth of 20 inches
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

Wilsoncreek and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

250—Llanoseco silty clay loam, 0 to 2 percent slopes, occasionally flooded

Map Unit Setting

General location: Western Butte County
Major uses: Nonirrigated crops and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 105 feet (30 to 33 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Llanoseco silty clay loam, occasionally flooded—90 percent
Minor components—10 percent

Characteristics of Llanoseco Silty Clay Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Wheat, annual grasses and forbs, and scattered valley oak
Surface feature: During periods of flooding, thin layers of silt are deposited on the surface.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 60 to 120 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Dams and levees along the Sacramento River and its tributaries, drainage ditches, and leveling for agriculture have altered the hydrology, modifying the frequency and duration of saturation, ponding, and flooding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Rare
- *Depth to a water table (zone of saturation):* 40 to 91 inches
- *Available water capacity:* Very high (about 10.2 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 2w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 63 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
Ap—0 to 8 inches; silty clay loam
2A—8 to 18 inches; silty clay loam
3Bss1—18 to 28 inches; silty clay
3Bss2—28 to 41 inches; silty clay
3Bss3—41 to 57 inches; silty clay
3Bss4—57 to 71 inches; silty clay
3Bk1—71 to 83 inches; silty clay
3Bk2—83 to 89 inches; silty clay
4Bkqm—89 to 93 inches; duripan

Minor Components in Map Unit 250

Whitecabin and similar soils
Composition: 7 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils in channels
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

Farwell silty clay and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Margins of flood plains and flood basins
Hydric soil status: Not hydric

252—Whitecabin-Ordferry silty clays, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 100 feet (29 to 32 meters)
Mean annual precipitation: 18 to 19 inches (457 to 482 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Whitecabin silty clay, occasionally flooded—60 percent
Ordferry silty clay, occasionally flooded—25 percent
Minor components—15 percent

Characteristics of Whitecabin Silty Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks

Observed vegetation: Rice, pasture species, meadow barley, wildrye, curly dock, spikerush, dallisgrass, bermudagrass, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, filaree, soft chess, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 53 inches
Available water capacity: High (about 8.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3w-2
Land capability, nonirrigated: 3w-2
Storie index: 26 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 5 inches; silty clay
Bss1—5 to 13 inches; silty clay
Bss2—13 to 26 inches; silty clay
Bss3—26 to 35 inches; silty clay
Bkss—35 to 45 inches; silty clay
Bk—45 to 53 inches; silty clay
2Bkqm1—53 to 63 inches; duripan
2Bkqm2—63 to 72 inches; duripan

Characteristics of Ordferry Silty Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, pasture species, meadow barley, medusahead, ripgut brome, wildrye, curly dock, spikerush, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: None

Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; silty clay
A2—3 to 6 inches; silty clay
Bss1—6 to 13 inches; silty clay
Bss2—13 to 25 inches; silty clay
Bk—25 to 29 inches; silty clay
2Bkqm1—29 to 33 inches; duripan
2Bkqm2—33 to 40 inches; duripan

Minor Components in Map Unit 252

Clear Lake clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Oroville taxadjunct, leveled, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Soils that are frequently flooded
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on flood basins
Hydric soil status: Hydric

252yu—Woodleaf gravelly loam, 3 to 15 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Limited timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,195 feet (610 to 975 meters)
Mean annual precipitation: 50 to 72 inches (1,270 to 1,829 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 140 to 190 days

Map Unit Composition

Woodleaf gravelly loam—80 percent
Minor components—20 percent

Characteristics of Woodleaf Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ultramafic mountains
Parent material: Clayey residuum weathered from ultramafic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.6 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7e-1
- *Land capability, nonirrigated:* 7e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A1 and A2—0 to 9 inches; gravelly loam
- 2Bt1 and 2Bt2—9 to 28 inches; very gravelly clay loam and very gravelly clay
- R—28 inches; bedrock

Minor Components in Map Unit 252yu

Sites and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Metamorphic mountains
Hydric soil status: Not hydric

Mariposa and similar soils
Composition: 4 percent
Slope: 3 to 15 percent

Hydric soil status: Not hydric

Earlal and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ultramafic mountains
Hydric soil status: Not hydric

Rogerville silt loam and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ultramafic mountains
Hydric soil status: Not hydric

253yu—Woodleaf gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: Yuba County and southeastern Butte County
Major uses: Limited timber production and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,195 feet (610 to 975 meters)
Mean annual precipitation: 50 to 72 inches (1,270 to 1,829 millimeters)
Mean annual air temperature: 50 to 57 degrees F (10 to 14 degrees C)
Frost-free period: 140 to 190 days

Map Unit Composition

Woodleaf gravelly loam—80 percent
Minor components—20 percent

Characteristics of Woodleaf Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ultramafic mountains
Parent material: Clayey residuum weathered from ultramafic rocks
Observed vegetation: Mixed conifers, hardwoods, brush, grasses, and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.6 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A1 and A2—0 to 9 inches; gravelly loam
2Bt1 and 2Bt2—9 to 28 inches; very gravelly clay loam and very gravelly clay
R—28 inches; bedrock

Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ultramafic mountains
Hydric soil status: Not hydric

255—Whitecabin-Ordferry complex, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Cropland, pasture, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 105 feet (29 to 33 meters)
Mean annual precipitation: 18 to 19 inches (457 to 482 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Whitecabin silty clay loam, occasionally flooded—60 percent
Ordferry silty clay, occasionally flooded—30 percent
Minor components—10 percent

Characteristics of Whitecabin Silty Clay Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, meadow barley, wildrye, curly dock, spikerush, dallisgrass, bermudagrass, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, filaree, soft chess, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 53 inches
- *Available water capacity:* Moderate (about 7.4 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 3w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 44 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 8 inches; silty clay loam
- Bssb1—8 to 20 inches; clay
- Bssb2—20 to 44 inches; clay
- 2Bkqmb—44 to 60 inches; duripan

Characteristics of Ordferry Silty Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks

Observed vegetation: Rice, meadow barley, medusahead, ripgut brome, wildrye, curly dock, spikerush, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; silty clay
A2—3 to 6 inches; silty clay
Bss1—6 to 13 inches; silty clay
Bss2—13 to 25 inches; silty clay
Bk—25 to 29 inches; silty clay
2Bkqm1—29 to 33 inches; duripan
2Bkqm2—33 to 40 inches; duripan

Minor Components in Map Unit 255

Soils that are frequently flooded
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

Clear Lake clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

256—Whitecabin silt loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 100 feet (29 to 30 meters)
Mean annual precipitation: 18 to 19 inches (457 to 482 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Whitecabin silt loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Whitecabin Silt Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, meadow barley, wildrye, curly dock, spikerush, dallisgrass, bermudagrass, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, filaree, soft chess, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 53 inches
- *Available water capacity:* High (about 8.6 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 3w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 49 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
Ap—0 to 6 inches; silt loam
Bss1—6 to 13 inches; clay
Bss2—13 to 27 inches; clay
Bkss—27 to 42 inches; clay
2Bk—42 to 54 inches; clay loam
2Bkqm—54 to 62 inches; duripan

Minor Components in Map Unit 256

Soils that are frequently flooded
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

Clear Lake clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Ordferry clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

257—Llanoseco silty clay loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Nonirrigated crops and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 95 feet (27 to 30 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Llanoseco silty clay loam, frequently flooded—90 percent
Minor components—10 percent

Characteristics of Llanoseco Silty Clay Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Wheat, annual grasses and forbs, and scattered valley oak
Surface feature: During periods of flooding, thin layers of silt are deposited on the surface.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None

Depth to a restrictive feature (duripan): 60 to 120 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Hydrology has been altered by levee construction along the Sacramento River. Historically, flooding occurred more frequently and at a lower velocity.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Rare
- *Depth to a water table (zone of saturation):* 40 to 91 inches
- *Available water capacity:* Very high (about 10.2 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 53 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 8 inches; silty clay loam
- 2A—8 to 18 inches; silty clay loam
- 3Bss1—18 to 28 inches; silty clay
- 3Bss2—28 to 41 inches; silty clay
- 3Bss3—41 to 57 inches; silty clay
- 3Bss4—57 to 71 inches; silty clay
- 3Bk1—71 to 83 inches; silty clay
- 3Bk2—83 to 89 inches; silty clay
- 4Bkqm—89 to 93 inches; duripan

Minor Components in Map Unit 257

Whitecabin and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils in channels
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on flood basins
Hydric soil status: Hydric

Soils that are deep
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

Farwell silty clay and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Margins of flood plains and flood basins
Hydric soil status: Not hydric

258—Codora silty clay loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Southwestern Butte County and southeastern Glenn County
Major uses: Nonirrigated and irrigated crops and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 90 to 95 feet (27 to 29 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Codora silty clay loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Codora Silty Clay Loam, Occasionally Flooded

Slope: 0 to 2 percent
Geomorphic position: Flood plains
Parent material: Silty and clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Annual grasses and forbs
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Dams and levees along the Sacramento River and its tributaries, drainage ditches, and leveling for agriculture have altered the hydrology, modifying the frequency and duration of saturation, ponding, and flooding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Occasional
- *Depth to a water table (zone of saturation):* 38 to 80 inches
- *Available water capacity:* Very high (about 11.0 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 3w-2
- *Land capability, nonirrigated:* 2w-2
- *Storie index:* 62 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- Ap—0 to 6 inches; silty clay loam
- A—6 to 11 inches; silty clay loam
- Bw1—11 to 22 inches; silty clay loam
- Bw2—22 to 38 inches; silty clay loam
- Bw3—38 to 60 inches; silty clay loam

Minor Components in Map Unit 258

Marvin and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Llanoseco and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Columbia taxadjunct and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

260—Ordferry silty clay, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 105 feet (30 to 33 meters)
Mean annual precipitation: 18 to 19 inches (457 to 482 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Ordferry silty clay, occasionally flooded—90 percent
Minor components—10 percent

Characteristics of Ordferry Silty Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, pasture species, meadow barley, medusahead, ripgut brome, wildrye, curly dock, spikerush, cocklebur, Italian ryegrass, Fitch spikeweed, hayfield tarweed, and prickly lettuce
Surface features: The surface has been leveled for agriculture. Slow-moving floodwaters carry sediment that is deposited in very small increments during each period of flooding. The surface layer may be silt loam or silty clay loam. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; silty clay
A2—3 to 6 inches; silty clay
Bss1—6 to 13 inches; silty clay
Bss2—13 to 25 inches; silty clay
Bk—25 to 29 inches; silty clay
2Bkqm1—29 to 33 inches; duripan
2Bkqm2—33 to 40 inches; duripan

Minor Components in Map Unit 260

Whitecabin and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon, overwash, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Neerdobe and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 1 percent
Slope: 0 to 1 percent

Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on flood basins
Hydric soil status: Hydric

280—Columbia taxadjunct very fine sandy loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Western Butte County
Major uses: Wildlife habitat, watershed, and recreation
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 150 feet (27 to 46 meters)
Mean annual precipitation: 18 to 22 inches (457 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Columbia taxadjunct stratified very fine sandy loam—80 percent
Minor components—20 percent

Characteristics of Columbia Taxadjunct Stratified Very Fine Sandy Loam

Slope: 0 to 1 percent
Geomorphic position: Channels and oxbows on flood plains
Parent material: Sandy alluvium over silty alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Riparian vegetation, such as willows, California sycamore, blackberry, wild grape, sedges, and grasses
Surface feature: Floodwaters deposit fresh sediment annually.
Texture of the surface layer: Stratified fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 0 to 24 inches
- *Available water capacity:* High (about 9.1 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 5w-2

Land capability, nonirrigated: 5w-2
Storie index: 49 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
C1—0 to 8 inches; stratified fine sandy loam
C2—8 to 10 inches; fine sandy loam
C3—10 to 19 inches; stratified fine sandy loam
C4—19 to 30 inches; stratified fine sandy loam
C5—30 to 40 inches; stratified silt loam
C6—40 to 60 inches; stratified silt loam

Minor Components in Map Unit 280

Columbia sand and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels and oxbows on flood plains
Hydric soil status: Hydric

Parrott silt loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Bars on flood plains
Hydric soil status: Not hydric

Riverwash
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Gravel bars in channels
Hydric soil status: Hydric

Oxbow lakes
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Oxbows on flood plains
Hydric soil status: Hydric

290—Perkins gravelly loam, 0 to 2 percent slopes

Map Unit Setting

General location: Southeastern Butte County
Major uses: Pasture, homesite development, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 225 feet (38 to 70 meters)
Mean annual precipitation: 25 inches (635 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Perkins gravelly loam—90 percent
Minor components—10 percent

Characteristics of Perkins Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Low terraces
Parent material: Fine-loamy alluvium over sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and scattered blue oak
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent fine, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 60 to 80 inches
Available water capacity: Moderate (about 5.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2s-4
Land capability, nonirrigated: 3s-4
Storie index: 53 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 8 inches; gravelly loam
Bt1—8 to 24 inches; gravelly loam
Bt2—24 to 38 inches; very gravelly sandy clay loam
BC—38 to 48 inches; very gravelly sandy loam
C—48 to 73 inches; very gravelly sandy loam

Minor Components in Map Unit 290

Kimball loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Eastbiggs loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are frequently flooded
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on low terraces
Hydric soil status: Hydric

300—Redsluff gravelly loam, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Homesite development, irrigated crops, livestock grazing, woodland, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 175 to 400 feet (54 to 122 meters)
Mean annual precipitation: 24 to 29 inches (610 to 737 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Redsluff gravelly loam—80 percent
Minor components—20 percent

Characteristics of Redsluff Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Parent material: Fine-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks over gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs, valley oak, blue oak, interior live oak, foothill pine, and almond orchards
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 15 percent medium, rounded gravel, 0 to 5 percent rounded cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 35 to 80 inches
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2s-11
Land capability, nonirrigated: 3s-11
Storie index: 52 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 2 inches; gravelly loam
Bt1—2 to 5 inches; gravelly loam
Bt2—5 to 12 inches; gravelly clay loam
Bt3—12 to 21 inches; gravelly loam
Bt4—21 to 29 inches; gravelly loam
Bt5—29 to 37 inches; gravelly loam
Bt6—37 to 42 inches; extremely gravelly sandy loam
Cq—42 to 80 inches; extremely gravelly loamy sand

Minor Components in Map Unit 300

Fernandez sandy loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Intermediate fan terraces
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to weakly cemented material
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

Typic Haploxeralfs, very deep, and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Intermediate fan terraces
Hydric soil status: Not hydric

Anita soils with a gravelly duripan and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on low fan terraces
Hydric soil status: Hydric

Pachic Argixerolls and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

Redtough and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: High fan terraces
Hydric soil status: Not hydric

Munjar and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Intermediate fan terraces
Hydric soil status: Not hydric

301—Wafap-Hamslough complex, 0 to 2 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 150 to 440 feet (47 to 135 meters)
Mean annual precipitation: 25 to 28 inches (635 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Wafap gravelly loam—70 percent
Hamslough clay—15 percent
Minor components—15 percent

Characteristics of Wafap Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Bars on low stream terraces
Parent material: Gravelly and clayey alluvium over cobbly alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent fine, rounded gravel, 0 to 5 percent rounded cobbles, 0 to 2 percent rounded stones
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 13 to 60 inches
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 24 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; cobbly clay loam
Bt2—5 to 13 inches; very cobbly clay loam
Bt3—13 to 32 inches; extremely cobbly clay loam
Bt4—32 to 39 inches; extremely cobbly clay loam
Btq—39 to 46 inches; extremely gravelly sandy clay loam
2Bqm—46 inches; cemented, cobbly and gravelly duripan

Characteristics of Hamslough Clay

Slope: 0 to 2 percent
Geomorphic position: Channels on low stream terraces
Parent material: Clayey alluvium over clayey and gravelly alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, rounded gravel, 0 to 25 percent rounded cobbles
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent

Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 5 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay
A2—3 to 14 inches; cobbly clay
Bw—14 to 19 inches; extremely gravelly clay
Bg—19 to 27 inches; extremely gravelly sandy clay
2Bqm—27 inches; cemented, cobbly and gravelly duripan

Minor Components in Map Unit 301

Loamy-skeletal soils that are 40 to 60 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on low stream terraces
Hydric soil status: Not hydric

Fine textured soils that are 40 to 60 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on low stream terraces
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on low stream terraces
Hydric soil status: Not hydric

Tuscan taxadjunct and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on low stream terraces
Hydric soil status: Not hydric

Anita soils with a gravelly duripan and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Clayey swales on stream terraces
Hydric soil status: Hydric

Oxyaquic Argixerolls, very stony, and similar soils
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Areas along the upper reaches of streams in canyons on stream terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools in channels on low stream terraces
Hydric soil status: Hydric

Soils that are frequently flooded
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

302—Redtough-Redswale complex, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 200 to 400 feet (61 to 122 meters)
Mean annual precipitation: 23 to 28 inches (584 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Redtough loam—50 percent
Redswale cobbly loam—35 percent
Minor components—15 percent

Characteristics of Redtough Loam

Slope: 0 to 3 percent
Geomorphic position: Mounds on high fan terraces
Parent material: Loamy alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, well rounded gravel, 0 to 10 percent well rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches (fig. 25)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 1.6 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Storie index: 11 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Figure 25.—Exposure of a duripan, a pedogenic, silica-cemented layer, which underlies the Redtough and Redswale soils. These soils occur on terraces in areas of the Red Bluff Formation.

Typical profile

A—0 to 1 inch; loam
Bt1—1 to 7 inches; gravelly loam
Bt2—7 to 13 inches; very cobbly loam
Bqm—13 inches; cemented, very gravelly duripan

Characteristics of Redswale Cobbly Loam

Slope: 0 to 3 percent
Geomorphic position: Swales on high fan terraces
Parent material: Cobbly and loamy alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Cobbly loam
Percentage of the surface covered by rock fragments: 5 to 25 percent coarse, well rounded gravel, 0 to 40 percent well rounded cobbles, 0 to 5 percent well rounded stones
Depth to a restrictive feature (duripan): 4 to 10 inches (fig. 25)
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)

Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Storie index: 4 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; cobbly loam
Bt—1 to 7 inches; very cobbly loam
Bqm—7 inches; cemented, very gravelly duripan

Minor Components in Map Unit 302

Soils that are frequently ponded for long periods
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on high fan terraces
Hydric soil status: Hydric

Redswale soils that are frequently flooded for long periods and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Large swales on high fan terraces
Hydric soil status: Hydric

Anita soils with a gravelly duripan and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Clayey swales on high fan terraces
Hydric soil status: Hydric

Tuscan and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on high fan terraces
Hydric soil status: Not hydric

Abruptic Durixeralfs and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on high fan terraces
Hydric soil status: Not hydric

Munjar and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on high fan terraces
Hydric soil status: Not hydric

Soils on riser slopes
Composition: 1 percent
Slope: 10 to 35 percent
Geomorphic position: Risers on the edge of high fan terraces
Hydric soil status: Not hydric

303—Munjar-Tuscan taxadjunct-Galt complex, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 180 to 395 feet (56 to 121 meters)
Mean annual precipitation: 23 to 26 inches (584 to 660 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Munjar gravelly loam—60 percent
Tuscan taxadjunct gravelly clay loam—20 percent
Galt clay—10 percent
Minor components—10 percent

Characteristics of Munjar Gravelly Loam

Slope: 0 to 2 percent
Geomorphic position: Bars and mounds on intermediate fan terraces
Parent material: Loamy, cobbly and gravelly alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent coarse, well rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (minimum depth to zone of saturation):* 12 to 40 inches
- *Saturated hydraulic conductivity (lowest Ksat):* Moderately slow (0.2 to less than 0.6 in/hr)
- *Available water capacity:* Low (about 3.0 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6s-3
- *Land capability, nonirrigated:* 6s-3
- *Storie index:* 21 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 2 inches; gravelly loam
- Bt1—2 to 5 inches; gravelly loam
- Bt2—5 to 9 inches; gravelly loam
- Bt3—9 to 16 inches; gravelly loam
- Bt4—16 to 22 inches; extremely gravelly clay loam

2Btq—22 to 31 inches; extremely cobbly sandy clay
2Btqm—31 to 46 inches; extremely gravelly duripan

Characteristics of Tuscan Taxadjunct Gravelly Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Mounds on intermediate fan terraces
Parent material: Gravelly and clayey alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly clay loam
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, rounded gravel, 0 to 10 percent rounded cobbles
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (minimum depth to zone of saturation): 2 to 40 inches
Saturated hydraulic conductivity (lowest Ksat): Slow (0.06 to less than 0.2 in/hr)
Available water capacity: Low (about 3.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-8
Land capability, nonirrigated: 5w-8
Storie index: 15 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly clay loam
Bt1—2 to 5 inches; gravelly clay
Bt2—5 to 13 inches; gravelly clay
Bt3—13 to 23 inches; gravelly clay loam
Bt4—23 to 29 inches; very gravelly clay loam
2Bqm—29 inches; extremely cobbly duripan

Characteristics of Galt Clay

Slope: 0 to 2 percent
Geomorphic position: Swales on intermediate fan terraces
Parent material: Clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Water table (minimum depth to zone of saturation): 0 to 40 inches

Saturated hydraulic conductivity (lowest Ksat): Slow (0.06 to less than 0.2 in/hr)
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay
A2—3 to 13 inches; clay
Bss—13 to 29 inches; clay
Bkss—29 to 32 inches; clay
2Bkqm—32 to 39 inches; duripan

Minor Components in Map Unit 303

Anita clay and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Swales on fan terraces
Hydric soil status: Hydric

Tuscan gravelly loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Mounds on fan terraces
Hydric soil status: Not hydric

Redding loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Mounds on fan terraces
Hydric soil status: Not hydric

Soils in cobble-lined channels
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Channels on fan terraces
Hydric soil status: Hydric

Areas where volcanic sediment crops out
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on fan terraces
Hydric soil status: Hydric

304—Redtough loam, 8 to 35 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 200 to 295 feet (61 to 91 meters)
Mean annual precipitation: 23 to 28 inches (584 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 255 days

Map Unit Composition

Redtough loam—80 percent
Minor components—20 percent

Characteristics of Redtough Loam

Slope: 8 to 35 percent
Geomorphic position: Riser slopes on high fan terraces
Parent material: Loamy alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, well rounded gravel, 0 to 10 percent well rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 1.6 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 7s-8
- *Land capability, nonirrigated:* 7s-8
- *Storie index:* 12 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 1 inch; loam
- Bt1—1 to 7 inches; gravelly loam
- Bt2—7 to 13 inches; very cobbly loam
- Bqm—13 inches; cemented, very gravelly duripan

Minor Components in Map Unit 304

Soils that are 20 to 40 inches deep to a duripan
Composition: 10 percent
Slope: 8 to 35 percent
Geomorphic position: Riser slopes on high fan terraces
Hydric soil status: Not hydric

Redswale and similar soils
Composition: 8 percent
Slope: 8 to 35 percent
Geomorphic position: Riser slopes on high fan terraces
Hydric soil status: Not hydric

Areas where a duripan crops out
Composition: 2 percent
Slope: 8 to 35 percent
Geomorphic position: Riser slopes on high fan terraces
Hydric soil status: Not hydric

305—Redtough-Redswale-Anita, gravelly duripan, complex, 0 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, watershed, and wildlife habitat
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 265 feet (44 to 81 meters)
Mean annual precipitation: 26 to 28 inches (660 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Redtough gravelly loam—45 percent
Redswale loam—25 percent
Anita gravelly clay, gravelly duripan—20 percent
Minor components—10 percent

Characteristics of Redtough Gravelly Loam

Slope: 0 to 5 percent
Geomorphic position: Mounds on strath terraces
Parent material: Loamy alluvium derived from volcanic and sedimentary rocks over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, well rounded gravel
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8

Storie index: 39 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 5 inches; gravelly loam
Bt2—5 to 8 inches; gravelly loam
Bt3—8 to 15 inches; clay loam
2Bqm—15 inches; cemented, very gravelly duripan

Characteristics of Redswale Loam

Slope: 0 to 5 percent
Geomorphic position: Swales on strath terraces
Parent material: Loamy and gravelly alluvium derived from volcanic and sedimentary rocks over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 5 to 25 percent coarse, well rounded gravel
Depth to a restrictive feature (duripan): 4 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.6 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Storie index: 39 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; loam
Bt—1 to 5 inches; very gravelly loam
2Bqm—5 inches; cemented, very gravelly duripan

Characteristics of Anita Gravelly Clay, Gravelly Duripan

Slope: 0 to 2 percent
Geomorphic position: Large swales on strath terraces
Parent material: Clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly clay
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel, 0 to 60 percent subrounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth

to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.

Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Storie index: 12 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly clay
Bss1—3 to 8 inches; gravelly clay
Bss2—8 to 15 inches; gravelly clay
2Bkqm—15 inches; cemented, gravelly duripan

Minor Components in Map Unit 305

Tuscan and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Mounds on strath terraces
Hydric soil status: Not hydric

Fallager loam and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Swales on strath terraces
Hydric soil status: Not hydric

Areas where a duripan crops out
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on strath terraces
Hydric soil status: Hydric

Areas of sandstone outcrops
Composition: 1 percent
Slope: 0 to 5 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Soils that have slopes of more than 50 percent
Composition: 1 percent
Slope: 50 to 150 percent

Geomorphic position: Cliffs on strath terraces
Hydric soil status: Not hydric

306—Duric Xerarents complex, 0 to 1 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Cropland
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 130 to 170 feet (40 to 53 meters)
Mean annual precipitation: 26 inches (660 millimeters)
Mean annual air temperature: 63 degrees F (17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Duric Xerarents, fill—50 percent
Duric Xerarents, cut—40 percent
Minor components—10 percent

Characteristics of Duric Xerarents, Fill

Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Parent material: Human-transported, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 14 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Moderate (about 5.9 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 7w-2
- *Land capability, nonirrigated:* 7w-2
- *Storie index:* 34 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 8 inches; loam
- C1—8 to 14 inches; sandy clay loam
- C2—14 to 20 inches; sandy clay loam

Ab—20 to 36 inches; sandy loam
Btb—36 to 40 inches; clay
2Bqmb—40 inches; duripan

Characteristics of Duric Xerarents, Cut

Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Parent material: Human-altered, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 4 to 22 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Very low (about 1.8 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Storie index: 14 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 13 inches; sandy loam
B—13 to 15 inches; gravelly sandy loam
2Bqm—15 inches; duripan

Minor Components in Map Unit 306

Tuscan and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Fallager loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Anita and similar soils
Composition: 2 percent
Slope: 0 to 1 percent

Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Redtough and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

307—Duric Xerarents, 0 to 1 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Cropland, some of which is used for orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 125 to 170 feet (39 to 52 meters)
Mean annual precipitation: 24 to 26 inches (610 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Duric Xerarents clay loam, leveled—70 percent
Minor components—30 percent

Characteristics of Duric Xerarents Clay Loam, Leveled

Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Parent material: Human-transported, clayey alluvium over cemented alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, rice, and almond orchards
Surface features: The surface has been leveled for agricultural production. Textures, depth to a restrictive layer, and horizonation vary greatly because of cuts and fills.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, well rounded gravel
Depth to a restrictive feature (duripan): 10 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Very low (about 1.9 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 7w-2
- *Land capability, nonirrigated:* 7w-2
- *Storie index:* 11 (revised)

Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 2 inches; clay loam
Bt—2 to 12 inches; clay
2Bqm—12 inches; duripan

Minor Components in Map Unit 307

Tuscan and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Fallager loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Anita soils with a gravelly duripan and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Clearhayes and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Redsluff taxadjunct and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

Soils in areas of cuts and fills
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled strath terraces
Hydric soil status: Hydric

310—Kimball loam, 1 to 3 percent slopes

Map Unit Setting

General location: Southern Butte County
Major uses: Cropland, livestock grazing, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 120 feet (26 to 38 meters)
Mean annual precipitation: 21 to 24 inches (533 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Kimball loam—85 percent
Minor components—15 percent

Characteristics of Kimball Loam

Slope: 0 to 3 percent
Geomorphic position: Low terraces
Parent material: Fine-loamy alluvium over clayey alluvium over fine-loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 17 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 2.8 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 2s-3
- *Land capability, nonirrigated:* 3s-3
- *Storie index:* 58 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- Ap1—0 to 2 inches; loam
- Ap2—2 to 4 inches; loam
- Ap3—4 to 6 inches; loam
- A—6 to 10 inches; loam
- BAt—10 to 17 inches; loam
- 2Btss—17 to 34 inches; clay
- 2Bt—34 to 46 inches; sandy clay loam
- 2BC—46 to 64 inches; sandy clay loam

Minor Components in Map Unit 310

Eastbiggs loam and similar soils
Composition: 5 percent
Slope: 0 to 3 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Galt clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Small basins and drainageways on low terraces
Hydric soil status: Hydric

Soils that are more than 40 inches deep to a duripan
Composition: 5 percent

Slope: 0 to 3 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

317—Thompsonflat loam, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 160 to 495 feet (49 to 152 meters)
Mean annual precipitation: 22 to 30 inches (559 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Thompsonflat loam—75 percent
Minor components—25 percent

Characteristics of Thompsonflat Loam

Slope: 2 to 15 percent
Geomorphic position: High terraces
Parent material: Loamy alluvium over clayey alluvium over noncemented or very weakly cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, buckbrush, foothill pine, and scattered interior live oak; in some areas, only annual grasses and forbs
Surface feature: Many areas have been leveled for homesite development.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 0 to 2 percent well rounded cobbles
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 40 to 81 inches
- *Available water capacity:* Moderate (about 5.7 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 3e-3
- *Land capability, nonirrigated:* 3e-3
- *Storie index:* 83 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 2 inches; loam
- Bt1—2 to 5 inches; gravelly loam
- Bt2—5 to 12 inches; gravelly loam
- Bt3—12 to 19 inches; gravelly loam

Bt4—19 to 29 inches; gravelly clay loam
2Bt5—29 to 35 inches; very gravelly clay
3Bq1—35 to 43 inches; extremely gravelly sandy clay loam
3Bq2—43 to 80 inches; extremely gravelly sandy clay loam

Minor Components in Map Unit 317

Oroville and similar soils
Composition: 10 percent
Slope: 2 to 15 percent
Geomorphic position: High terraces
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 5 percent
Slope: 2 to 5 percent
Geomorphic position: Mounds and swales on high terraces
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to a duripan
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: High terraces
Hydric soil status: Not hydric

Rock outcrop (mudflow or tuff)
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Hills
Hydric soil status: Not hydric

Fine textured soils that are 40 to 60 inches deep to densic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Risers on terraces
Hydric soil status: Not hydric

Vertisols with a duripan at a depth of 20 to 40 inches and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Small basins on high terraces
Hydric soil status: Hydric

318—Thompsonflat-Oroville complex, 0 to 9 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, homesite development, and some orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 255 feet (37 to 79 meters)
Mean annual precipitation: 22 to 30 inches (559 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Thompsonflat fine sandy loam—50 percent
Oroville gravelly fine sandy loam—40 percent
Minor components—10 percent

Characteristics of Thompsonflat Fine Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Intermediate terraces
Parent material: Loamy alluvium over clayey alluvium over sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and some olive orchards
Surface feature: Some areas have been leveled for homesite development.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 0 to 2 percent well rounded cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 40 to 81 inches
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 83 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 7 inches; fine sandy loam
Bt2—7 to 11 inches; sandy clay loam
Bt3—11 to 15 inches; sandy clay
2Bt4—15 to 22 inches; gravelly sandy clay
3Btq1—22 to 35 inches; extremely gravelly sandy clay loam
3Btq2 to 3Btq5—35 to 80 inches; extremely gravelly coarse sandy loam

Characteristics of Oroville Gravelly Fine Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces
Parent material: Loamy and gravelly alluvium over clayey and gravelly alluvium over cemented, loamy and extremely gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and some olive orchards
Texture of the surface layer: Gravelly fine sandy loam
Percentage of the surface covered by rock fragments: 5 to 20 percent coarse, well rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-3
Land capability, nonirrigated: 4e-3
Storie index: 7 (revised)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly fine sandy loam
BAt—2 to 6 inches; gravelly sandy loam
Bt1—6 to 13 inches; gravelly clay loam
2Bt2—13 to 17 inches; gravelly clay
2Btg—17 to 23 inches; gravelly sandy clay
3Bqm1 and 3Bqm2—23 to 60 inches; cemented, extremely gravelly duripan

Minor Components in Map Unit 318

Fernandez sandy loam and similar soils
Composition: 5 percent
Slope: 0 to 9 percent
Geomorphic position: Intermediate terraces
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 5 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Hydric

Fine-loamy soils that are 40 to 60 inches deep to densic bedrock
Composition: 2 percent
Slope: 0 to 9 percent
Geomorphic position: Intermediate terraces
Hydric soil status: Not hydric

320—Vistarobles-Redding complex, 0 to 9 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 225 feet (26 to 69 meters)
Mean annual precipitation: 20 to 28 inches (508 to 711 millimeters)

Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Vistarobles sandy loam—50 percent
Redding loam—40 percent
Minor components—10 percent

Characteristics of Vistarobles Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces
Parent material: Loamy alluvium over clayey and gravelly alluvium over cemented, sandy and gravelly alluvium over sandy and cobbly and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, rounded gravel, 0 to 5 percent rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 20 inches
- *Available water capacity:* Very low (about 1.9 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 7e-8
- *Land capability, nonirrigated:* 7e-8
- *Storie index:* 10 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- A1—0 to 5 inches; sandy loam
- A2—5 to 10 inches; sandy clay loam
- 2Bt—10 to 14 inches; gravelly clay
- 3Bqm—14 to 34 inches; cemented, gravelly duripan
- 3C—34 to 40 inches; very cobbly sandy loam

Characteristics of Redding Loam

Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, rounded gravel

Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 24 to 40 inches
Available water capacity: Moderate (about 5.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 32 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A1—0 to 4 inches; loam
A2—4 to 11 inches; loam
BA—11 to 24 inches; loam
2Bt—24 to 35 inches; clay
3Bqm—35 to 40 inches; cemented, very gravelly duripan

Minor Components in Map Unit 320

Galt clay and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Small basins on intermediate terraces
Hydric soil status: Hydric

Thermalito sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Hydric soil status: Not hydric

Fernandez sandy loam and similar soils
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Convex areas on intermediate terraces
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Hydric

Clayey soils that are 10 to 20 inches deep to a duripan
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Small basins, swales, and vernal pools on intermediate terraces
Hydric soil status: Hydric

321—Durixeralfs-Typic Petraquepts complex, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing and wildlife habitat
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 150 to 235 feet (46 to 72 meters)
Mean annual precipitation: 25 to 27 inches (635 to 686 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Durixeralfs, fine-loamy, gravelly fine sandy loam—50 percent
Durixeralfs, loamy-skeletal, gravelly fine sandy loam—20 percent
Typic Petraquepts silty clay—15 percent
Minor components—15 percent

Characteristics of Durixeralfs, Fine-Loamy, Gravelly Fine Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Mounds on strath terraces
Parent material: Loamy and gravelly alluvium over clayey and gravelly alluvium over cemented, very gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, subrounded gravel
Depth to a restrictive feature: 20 to 40 inches to a duripan; 32 to 64 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 20 to 40 inches
- *Available water capacity:* Low (about 3.1 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 4s-8
- *Land capability, nonirrigated:* 4s-8
- *Storie index:* 35 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 1 inch; gravelly fine sandy loam
- Bt1—1 to 5 inches; gravelly fine sandy loam
- Bt2—5 to 10 inches; gravelly loam
- Bt3—10 to 18 inches; gravelly loam
- Bt4—18 to 24 inches; very gravelly clay loam

2Bt5—24 to 27 inches; very gravelly sandy clay
3Bqm—27 inches; cemented, very gravelly duripan

Characteristics of Durixeralfs, Loamy-Skeletal, Gravelly Fine Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Swales on strath terraces
Parent material: Loamy and gravelly alluvium over cemented, very gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, well rounded gravel, 2 to 5 percent well rounded cobbles
Depth to a restrictive feature: 9 to 20 inches to a duripan; 21 to 44 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.0 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-8
Land capability, nonirrigated: 7w-8
Storie index: 13 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly fine sandy loam
Bt1—1 to 4 inches; gravelly loam
Bt2—4 to 9 inches; very cobbly clay loam
2Bqm—9 inches; cemented, very gravelly duripan

Characteristics of Typic Petraquepts Silty Clay

Slope: 0 to 1 percent
Geomorphic position: Swales on strath terraces
Parent material: Clayey and gravelly alluvium over cemented, very gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Surface feature: Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: 5 to 10 percent coarse, well rounded gravel, 0 to 5 percent well rounded cobbles
Depth to a restrictive feature: 10 to 20 inches to a duripan; 22 to 44 inches to paralithic bedrock
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent

Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-3
Land capability, nonirrigated: 7w-3
Storie index: 12 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; silty clay
Bss—3 to 11 inches; gravelly silty clay
2Bqm—11 inches; very gravelly duripan

Minor Components in Map Unit 321

Soils that are frequently ponded for long periods
Composition: 8 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on strath terraces
Hydric soil status: Hydric

Durixeralfs with 20 to 40 percent cobbles on the surface and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on strath terraces
Hydric soil status: Hydric

Soils in cobble-lined channels
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Ephemeral channels on strath terraces
Hydric soil status: Hydric

Vertisols with a duripan at a depth of 20 to 40 inches and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Basins on strath terraces
Hydric soil status: Hydric

330—Wilsoncreek-Trainer loams, 0 to 2 percent slopes, occasionally flooded

Map Unit Setting

General location: South-central Butte County
Major uses: Cropland, pasture, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 215 feet (23 to 67 meters)
Mean annual precipitation: 20 to 24 inches (508 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Wilsoncreek loam, occasionally flooded—60 percent
Trainer loam, occasionally flooded—25 percent
Minor components—15 percent

Characteristics of Wilsoncreek Loam, Occasionally Flooded

Slope: 0 to 2 percent
Geomorphic position: Bars on flood plains
Parent material: Fine-silty alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, valley oak, and rice
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 36 to 60 inches
- *Available water capacity:* High (about 9.5 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 2w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 79 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Ap—0 to 7 inches; loam
- A1—7 to 14 inches; loam
- A2—14 to 25 inches; loam
- A3—25 to 34 inches; loam
- Bw1—34 to 44 inches; loam
- Bw2—44 to 60 inches; loam

Characteristics of Trainer Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Parent material: Fine-loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, rice, and scattered willows
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 36 to 60 inches
- *Available water capacity:* Very high (about 10.8 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
Land capability, irrigated: 2w-2
Land capability, nonirrigated: 3w-2
Storie index: 69 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 7 inches; loam
A—7 to 13 inches; loam
Bt1—13 to 26 inches; loam
Bt2—26 to 36 inches; loam
C1—36 to 46 inches; fine sandy loam
C2—46 to 61 inches; sandy loam

Minor Components in Map Unit 330

Galt clay loam, ponded, and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Small basins on low terraces
Hydric soil status: Hydric

Eastbiggs loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Columbia and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Kimball and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

331—Thompsonflat loam, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 255 to 495 feet (79 to 152 meters)
Mean annual precipitation: 22 to 30 inches (559 to 762 millimeters)

Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Thompsonflat loam—85 percent
Minor components—15 percent

Characteristics of Thompsonflat Loam

Slope: 15 to 30 percent
Geomorphic position: High terraces
Parent material: Loamy alluvium over clayey alluvium over noncemented or very weakly cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, buckbrush, foothill pine, and scattered interior live oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 0 to 2 percent well rounded cobbles
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 40 to 81 inches
- *Available water capacity:* Moderate (about 5.7 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 4e-3
- *Land capability, nonirrigated:* 4e-3
- *Storie index:* 69 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 2 inches; loam
- Bt1—2 to 5 inches; gravelly loam
- Bt2—5 to 12 inches; gravelly loam
- Bt3—12 to 19 inches; gravelly loam
- Bt4—19 to 29 inches; gravelly clay loam
- 2Bt5—29 to 35 inches; very gravelly clay
- 3Bq1 and 3Bq2—35 to 80 inches; extremely gravelly sandy clay loam

Minor Components in Map Unit 331

Oroville and similar soils
Composition: 9 percent
Slope: 15 to 30 percent
Geomorphic position: High terraces
Hydric soil status: Not hydric

Escarpments
Composition: 3 percent
Slope: 30 to 150 percent

Geomorphic position: Risers on high terraces
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to a duripan
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: High terraces
Hydric soil status: Not hydric

335—Galt clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: Southern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 85 feet (24 to 27 meters)
Mean annual precipitation: 21 inches (533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 245 days

Map Unit Composition

Galt clay loam—85 percent
Minor components—15 percent

Characteristics of Galt Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Basins on low terraces
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Moderate (about 5.2 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 18 (revised)

Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 6 inches; clay loam
Bss1—6 to 20 inches; clay loam
Bss2—20 to 27 inches; clay
Bss3—27 to 30 inches; clay
2Bqm—30 inches; duripan

Minor Components in Map Unit 335

Eastbiggs loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Esquon clay and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Basins on low terraces
Hydric soil status: Hydric

Wilsoncreek loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

336—Galt clay, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Nonirrigated crops, livestock grazing, orchard crops, and commercial development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 135 to 295 feet (42 to 91 meters)
Mean annual precipitation: 22 to 25 inches (559 to 635 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Galt clay—90 percent
Minor components—10 percent

Characteristics of Galt Clay

Slope: 0 to 1 percent
Geomorphic position: Basins on terraces
Parent material: Clayey alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs, wheat, alfalfa, and prune and almond orchards
Surface features: In a few areas the surface has been leveled for agriculture. Polygonal cracks open during dry periods.

Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay
A2—3 to 13 inches; clay
Bss—13 to 29 inches; clay
Bkss—29 to 32 inches; clay
2Bkqm—32 to 39 inches; duripan

Minor Components in Map Unit 336

Anita clay and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Basins on terraces
Hydric soil status: Hydric

Fine-loamy soils that are 20 to 40 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Bosquejo clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

337—Galt clay loam, 0 to 1 percent slopes, leveled

Map Unit Setting

General location: Northwestern and southern Butte County
Major uses: Orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 180 feet (27 to 56 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Galt clay loam—85 percent
Minor components—15 percent

Characteristics of Galt Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous and metamorphic rocks
Observed vegetation: Almond and prune orchards and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Moderate (about 5.2 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 18 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 6 inches; clay loam
- Bss1—6 to 20 inches; clay loam
- Bss2—20 to 27 inches; clay
- Bss3—27 to 30 inches; clay
- 2Bqm—30 inches; duripan

Minor Components in Map Unit 337

Esquon clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Eastbiggs loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Boga loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Loemstone loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

338—Oxyaquic Xerofluvents silt loam, 0 to 1 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Orchard crops and nonirrigated crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 200 feet (38 to 61 meters)
Mean annual precipitation: 21 to 26 inches (533 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Oxyaquic Xerofluvents silt loam—90 percent
Minor components—10 percent

Characteristics of Oxyaquic Xerofluvents Silt Loam

Slope: 0 to 1 percent
Geomorphic position: Stream terraces
Parent material: Silty and coarse-loamy alluvium that is generated from hydraulic mines and is derived from sedimentary rocks
Observed vegetation: Almond orchards and wheat
Surface features: The natural soil surface has been buried by hydraulic-mine sediment and leveled for agriculture.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Hydrology has been altered by the deposition of hydraulic-mine sediment.
Annual flooding frequency: Rare
Annual ponding frequency: Rare
Depth to a water table (zone of saturation): 36 to 80 inches
Available water capacity: Moderate (about 7.0 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 3w-2
Land capability, nonirrigated: 3w-2
Storie index: 70 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 6 inches; silt loam
C1—6 to 20 inches; silt loam
C2—20 to 32 inches; loamy sand
C3—32 to 36 inches; loamy fine sand
C4—36 to 46 inches; coarse sand
C5—46 to 50 inches; silt loam
C6—50 to 55 inches; loamy fine sand
C7—55 to 60 inches; silt loam

Minor Components in Map Unit 338

Soils that are less than 10 inches deep to a duripan
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Terraces
Hydric soil status: Not hydric

Alluvial soils on strath terraces
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to buried basin clay
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Areas of hydraulic-mine sediment on stream terraces
Hydric soil status: Not hydric

339—Oxyaquic Xerofluvents sandy loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Wildlife habitat, borrow pits, and flood retention
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 95 to 150 feet (29 to 47 meters)

Mean annual precipitation: 21 to 26 inches (533 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Oxyaquic Xerofluvents sandy loam, frequently flooded—90 percent
Minor components—10 percent

Characteristics of Oxyaquic Xerofluvents Sandy Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood plains
Parent material: Silty and coarse-loamy alluvium that is generated from hydraulic mines and is derived from sedimentary rocks
Observed vegetation: Willows, alder, Oregon ash, California sycamore, valley oak, and annual grasses and forbs
Surface feature: Hydraulic-mine sediment has been deposited within the confines of artificial levees.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Hydrology has been altered by artificial drainage and by a canal constructed to protect farmland and to carry hydraulic-mine sediment from the Cherokee and Forks of Butte Gold Mines.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Rare
- *Depth to a water table (zone of saturation):* 36 to 80 inches
- *Available water capacity:* Moderate (about 6.3 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 56 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 8 inches; sandy loam
- C1—8 to 12 inches; sandy loam
- C2—12 to 16 inches; fine sandy loam
- C3—16 to 60 inches; stratified sandy loam to gravelly sand

Minor Components in Map Unit 339

Soils that are less than 20 inches deep to buried basin clay
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Soils that are less than 40 inches deep to a duripan
Composition: 2 percent

Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Riverwash
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Gravel bars in channels
Hydric soil status: Hydric

Typic Xerofluvents and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Near Butte Creek, soils that are occasionally flooded
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

340—Rock outcrop-Thermalrocks-Campbellhills complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, recreation, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 150 to 1,580 feet (46 to 482 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Rock outcrop (Lovejoy basalt)—35 percent
Thermalrocks very gravelly loam—25 percent
Campbellhills gravelly loam—20 percent
Minor components—20 percent

Characteristics of Rock Outcrop (Lovejoy Basalt)

Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Thermalrocks Very Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Parent material: Gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs, mosses, and lichens
Texture of the surface layer: Very gravelly loam

Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 2 to 50 percent angular cobbles
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very gravelly loam
Bt—1 to 5 inches; very gravelly loam
R—5 inches; bedrock

Characteristics of Campbellhills Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Fractures on the top of basalt plateaus
Parent material: Gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 25 percent medium, subangular gravel, 0 to 30 percent subangular cobbles
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 3 to 60 inches
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-4
Land capability, nonirrigated: 6e-4
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 7 inches; gravelly loam
Bt2—7 to 17 inches; very gravelly clay loam
Bt3—17 to 29 inches; very gravelly clay loam
Bt4—29 to 39 inches; extremely gravelly clay loam
Bt5—39 to 50 inches; extremely gravelly clay loam
R—50 inches; bedrock

Minor Components in Map Unit 340

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Not hydric

Beatsonhollow and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Swales on the top of basalt plateaus
Hydric soil status: Hydric

Escarpments
Composition: 3 percent
Slope: 70 to 200 percent
Geomorphic position: Escarpments on basalt plateaus
Hydric soil status: Not hydric

Cherotable and similar soils
Composition: 3 percent
Slope: 2 to 5 percent
Geomorphic position: Draws on the top of basalt plateaus
Hydric soil status: Not hydric

Soils that are in draws and have slopes of 15 to 50 percent
Composition: 2 percent
Slope: 15 to 50 percent
Geomorphic position: Draws
Hydric soil status: Not hydric

341—Elsey-Beatsonhollow-Campbellhills-Rock outcrop complex, 2 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, recreation, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 380 to 1,440 feet (116 to 439 meters)
Mean annual precipitation: 27 to 35 inches (686 to 889 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Elsey loam—25 percent
Beatsonhollow gravelly loam—25 percent
Campbellhills gravelly loam—20 percent
Rock outcrop (Lovejoy basalt)—20 percent
Minor components—10 percent

Characteristics of Elsey Loam

Slope: 2 to 5 percent
Geomorphic position: Mounds on the top of basalt plateaus

Parent material: Loamy residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 5 to 15 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 15 to 40 inches
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; loam
BAt—3 to 8 inches; gravelly loam
Bt1—8 to 17 inches; cobbly loam
Bt2—17 to 25 inches; cobbly loam
Bt3—25 to 32 inches; very cobbly loam
Bt4—32 to 38 inches; very cobbly loam
R—38 inches; bedrock

Characteristics of Beatsonhollow Gravelly Loam

Slope: 2 to 5 percent
Geomorphic position: Swales on the top of basalt plateaus
Parent material: Gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 20 percent medium, angular gravel, 10 to 15 percent angular cobbles
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; gravelly loam
A2—3 to 10 inches; cobbly loam
Bt—10 to 17 inches; very cobbly loam
R—17 inches; bedrock

Characteristics of Campbellhills Gravelly Loam

Slope: 2 to 5 percent
Geomorphic position: Fractures on the top of basalt plateaus
Parent material: Gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 25 percent medium, subangular gravel, 0 to 30 percent subangular cobbles
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 3 to 60 inches
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-4
Land capability, nonirrigated: 6e-4
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 7 inches; gravelly loam
Bt2—7 to 17 inches; very gravelly clay loam
Bt3—17 to 29 inches; very gravelly clay loam
Bt4—29 to 39 inches; extremely gravelly clay loam
Bt5—39 to 50 inches; extremely gravelly clay loam
R—50 inches; bedrock

Characteristics of Rock Outcrop (Lovejoy Basalt)

Slope: 2 to 5 percent
Geomorphic position: The top of basalt plateaus
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 341

Thermalrocks and similar soils
Composition: 4 percent
Slope: 2 to 5 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent

Geomorphic position: Vernal pools on the top of basalt plateaus
Hydric soil status: Hydric

Fine-loamy soils that are 20 to 40 inches deep to lithic bedrock
Composition: 2 percent
Slope: 2 to 5 percent
Geomorphic position: Swales on the top of basalt plateaus
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 5 percent
Geomorphic position: Mounds on the top of basalt plateaus
Hydric soil status: Not hydric

342—Thermalrocks-Beatsonhollow taxadjunct-Rock outcrop complex, 2 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 150 to 495 feet (46 to 152 meters)
Mean annual precipitation: 25 to 28 inches (635 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Thermalrocks very gravelly loam—40 percent
Beatsonhollow taxadjunct fine sandy loam—35 percent
Rock outcrop (Lovejoy basalt)—15 percent
Minor components—10 percent

Characteristics of Thermalrocks Very Gravelly Loam

Slope: 2 to 30 percent
Geomorphic position: Swales on the top and side slopes of the eroded remnants of basalt plateaus
Parent material: Gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs, mosses, and lichens
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, angular gravel, 0 to 25 percent angular cobbles, 0 to 10 percent angular stones
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very gravelly loam
Bt—1 to 5 inches; very gravelly loam
R—5 inches; bedrock

Characteristics of Beatsonhollow Taxadjunct Fine Sandy Loam

Slope: 2 to 30 percent
Geomorphic position: Mounds on the top and side slopes of the eroded remnants of basalt plateaus
Parent material: Loamy and gravelly residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 5 to 20 inches
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; fine sandy loam
Bt1—1 to 6 inches; gravelly loam
Bt2—6 to 10 inches; gravelly loam
Bt3—10 to 15 inches; gravelly loam
Bt4—15 to 18 inches; very gravelly loam
R—18 inches; bedrock

Characteristics of Rock Outcrop (Lovejoy Basalt)

Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of the eroded remnants of basalt plateaus
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 342

Beatsonhollow and similar soils
Composition: 4 percent

Slope: 2 to 30 percent
Geomorphic position: Swales on the top and side slopes of the eroded remnants of basalt plateaus
Hydric soil status: Hydric

Campbellhills gravelly loam and similar soils
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: Fractures on the top of eroded basalt plateaus
Hydric soil status: Not hydric

Elsey and similar soils
Composition: 2 percent
Slope: 2 to 30 percent
Geomorphic position: Mounds on the top and side slopes of the eroded remnants of basalt plateaus
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Vernal pools on the top of the eroded remnants of basalt plateaus
Hydric soil status: Hydric

343—Coalcanyon-Coonhollow complex, 5 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 200 to 1,000 feet (61 to 305 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coalcanyon very cobbly loam—50 percent
Coonhollow gravelly loam—35 percent
Minor components—15 percent

Characteristics of Coalcanyon Very Cobbly Loam

Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders

Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very cobbly loam
BAt—2 to 11 inches; very cobbly loam
Bt1—11 to 27 inches; very cobbly loam
Bt2—27 to 43 inches; very cobbly loam
Bt3—43 to 65 inches; extremely cobbly clay loam

Characteristics of Coonhollow Gravelly Loam

Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; gravelly loam
ABt—3 to 11 inches; very cobbly loam
Bt1—11 to 22 inches; very cobbly loam
Bt2—22 to 32 inches; extremely cobbly loam
Bt3—32 to 45 inches; extremely cobbly clay loam

Cr—45 to 50 inches; bedrock
R—50 inches; bedrock

Minor Components in Map Unit 343

Rock outcrop
Composition: 4 percent
Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Hydric soil status: Not hydric

Soils that are less than 60 inches deep to sediments of the lone Formation
Composition: 4 percent
Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Hydric soil status: Not hydric

Elsey and similar soils
Composition: 4 percent
Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Hydric soil status: Not hydric

Seeps
Composition: 2 percent
Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Hydric soil status: Hydric

Cherokeespring and similar soils
Composition: 1 percent
Slope: 5 to 15 percent
Geomorphic position: Benches and side slopes on basalt plateaus
Hydric soil status: Not hydric

344—Coalcanyon-Coonhollow-Rock outcrop complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 200 to 1,000 feet (61 to 305 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coalcanyon very cobbly loam—45 percent
Coonhollow gravelly loam—30 percent
Rock outcrop (Lovejoy basalt)—15 percent
Minor components—10 percent

Characteristics of Coalcanyon Very Cobbly Loam

Slope: 15 to 30 percent

Geomorphic position: Side slopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very cobbly loam
BAt—2 to 11 inches; very cobbly loam
Bt1—11 to 27 inches; very cobbly loam
Bt2—27 to 43 inches; very cobbly loam
Bt3—43 to 65 inches; extremely cobbly clay loam

Characteristics of Coonhollow Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; gravelly loam
ABt—3 to 11 inches; very cobbly loam
Bt1—11 to 22 inches; very cobbly loam
Bt2—22 to 32 inches; extremely cobbly loam
Bt3—32 to 45 inches; extremely cobbly clay loam
Cr—45 to 50 inches; bedrock
R—50 inches; bedrock

Characteristics of Rock Outcrop (Lovejoy Basalt)

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 344

Soils that are less than 60 inches deep to sediments of the Ione Formation
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Hydric soil status: Not hydric

Talus
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Hydric soil status: Not hydric

Elsey and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Hydric soil status: Not hydric

346—Cherotable-Elsey complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, recreation, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 160 to 1,540 feet (50 to 470 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Cherotable loam—50 percent
Elsey loam—35 percent
Minor components—15 percent

Characteristics of Cherotable Loam

Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Parent material: Loamy alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 15 percent medium, subrounded gravel
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 20 to 60 inches
Available water capacity: Moderate (about 6.2 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; loam
Bt2—8 to 14 inches; clay loam
Bt3—14 to 21 inches; gravelly clay loam
Bt4—21 to 30 inches; cobbly clay loam
Bt5—30 to 45 inches; very cobbly clay
R—45 inches; bedrock

Characteristics of Elsey Loam

Slope: 2 to 15 percent
Geomorphic position: Mounds on the top of basalt plateaus
Parent material: Loamy residuum weathered from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 5 to 15 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 15 to 40 inches
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8

Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; loam
BAt—3 to 8 inches; gravelly loam
Bt1—8 to 17 inches; cobbly loam
Bt2—17 to 25 inches; cobbly loam
Bt3—25 to 32 inches; very cobbly loam
Bt4—32 to 38 inches; very cobbly loam
R—38 inches; bedrock

Minor Components in Map Unit 346

Rock outcrop
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Not hydric

Thermalrocks and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Not hydric

Campbellhills gravelly loam and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Not hydric

Seeps
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of basalt plateaus
Hydric soil status: Hydric

347—Haplic Palexeralfs loam, 0 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 150 to 1,095 feet (46 to 335 meters)
Mean annual precipitation: 25 to 30 inches (635 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Haplic Palexeralfs loam—90 percent
Minor components—10 percent

Characteristics of Haplic Palexeralfs Loam

Slope: 0 to 5 percent

Geomorphic position: Low stream terraces
Parent material: Loamy and very gravelly alluvium over clayey and gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs and scattered valley oak, cottonwood, and willows
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 5 to 50 percent subrounded cobbles
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 60 to 80 inches
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3s-4
Land capability, nonirrigated: 3s-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 22 inches; very gravelly clay loam
2Bt3—22 to 31 inches; extremely gravelly sandy clay
2Bt4—31 to 45 inches; extremely gravelly sandy clay loam
2Bt5—45 to 52 inches; extremely gravelly sandy clay
3Bt6—52 to 64 inches; extremely cobbly sandy clay

Minor Components in Map Unit 347

Soils that are less than 60 inches deep to lone sandstone bedrock
Composition: 5 percent
Slope: 0 to 5 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Soils that are less than 60 inches deep to lithic bedrock
Composition: 3 percent
Slope: 0 to 5 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Durixeralfs and Petraquepts and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

353—Cherokeespring gravelly silt loam, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, orchard crops, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 455 to 1,440 feet (140 to 439 meters)
Mean annual precipitation: 27 to 37 inches (686 to 940 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Cherokeespring gravelly silt loam—80 percent
Minor components—20 percent

Characteristics of Cherokeespring Gravelly Silt Loam

Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Parent material: Silty alluvium derived from basalt
Observed vegetation: Annual grasses and forbs, Pacific poison oak and other oaks, and olive orchards
Texture of the surface layer: Gravelly silt loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 8.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 3 inches; gravelly silt loam
- Bt1—3 to 7 inches; gravelly silt loam
- Bt2—7 to 16 inches; gravelly silty clay loam
- Bt3—16 to 30 inches; gravelly silty clay loam
- Bt4—30 to 42 inches; gravelly silty clay loam
- Bt5—42 to 60 inches; very gravelly silty clay
- Bt6—60 to 68 inches; very gravelly silty clay

Minor Components in Map Unit 353

Coalcanyon very cobbly loam and similar soils
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Hydric soil status: Not hydric

Palexerults and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Hydric soil status: Not hydric

Seeps
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Hydric soil status: Hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Benches on side slopes on basalt plateaus
Hydric soil status: Not hydric

355—Coalcanyon-Talus complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 400 to 1,495 feet (122 to 457 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coalcanyon very cobbly loam—55 percent
Talus—35 percent
Minor components—10 percent

Characteristics of Coalcanyon Very Cobbly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Very cobbly loam

Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very cobbly loam
BAt—2 to 11 inches; very cobbly loam
Bt1—11 to 27 inches; very cobbly loam
Bt2—27 to 43 inches; very cobbly loam
Bt3—43 to 65 inches; extremely cobbly clay loam

Characteristics of Talus

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Surface runoff (bare conditions): Negligible
Definition: This talus consists of a pile of basalt rocks that accumulated at the base of a cliff by falling, sliding, or rolling from the cliff face.

Minor Components in Map Unit 355

Rock outcrop
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt plateaus
Hydric soil status: Not hydric

356—Coalcanyon-Rock outcrop, cliffs-Talus-Coonhollow complex, 30 to 200 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills

Elevation: 400 to 1,495 feet (122 to 457 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coalcanyon very cobbly loam—45 percent
Rock outcrop, basalt cliffs—20 percent
Talus—20 percent
Coonhollow gravelly loam—10 percent
Minor components—5 percent

Characteristics of Coalcanyon Very Cobbly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt plateaus
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-7
Land capability, nonirrigated: 6e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very cobbly loam
BAt—2 to 11 inches; very cobbly loam
Bt1—11 to 27 inches; very cobbly loam
Bt2—27 to 43 inches; very cobbly loam
Bt3—43 to 65 inches; extremely cobbly clay loam

Characteristics of Rock Outcrop, Basalt Cliffs

Slope: 50 to 200 percent
Geomorphic position: Backslopes on basalt plateaus
Surface runoff (bare conditions): Very high
Definition: A cliff is any high, very steep to perpendicular or overhanging face of rock.

Characteristics of Talus

Slope: 50 to 70 percent
Geomorphic position: Footslopes on plateaus
Surface runoff (bare conditions): Negligible

Definition: This talus consists of a pile of basalt rocks that accumulated at the base of a cliff by falling, sliding, or rolling from the cliff face.

Characteristics of Coonhollow Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt plateaus
Parent material: Gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, blue oak, valley oak, foothill pine, whiteleaf manzanita, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent medium, angular gravel, 5 to 65 percent angular cobbles, 0 to 25 percent angular stones, 0 to 20 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.2 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 6e-7
- *Land capability, nonirrigated:* 6e-7
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 3 inches; gravelly loam
- ABt—3 to 11 inches; very cobbly loam
- Bt1—11 to 22 inches; very cobbly loam
- Bt2—22 to 32 inches; extremely cobbly loam
- Bt3—32 to 45 inches; extremely cobbly clay loam
- Cr—45 to 50 inches; bedrock
- R—50 inches; bedrock

Minor Components in Map Unit 356

Soils that are less than 60 inches deep to sediments of the Ione Formation
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt plateaus
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt plateaus
Hydric soil status: Not hydric

Campbellhills gravelly loam and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt plateaus
Hydric soil status: Not hydric

360—Typic Xerofluvents complex, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Source of aggregate, wildlife habitat, watershed, and livestock grazing
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 150 to 360 feet (46 to 110 meters)
Mean annual precipitation: 24 to 30 inches (610 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 258 days

Map Unit Composition

Typic Xerofluvents, coarse-loamy—45 percent
Typic Xerofluvents, sandy-skeletal—40 percent
Minor components—15 percent

Characteristics of Typic Xerofluvents, Coarse-Loamy

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Sandy and gravelly alluvium generated from hydraulic mines and derived from sedimentary rocks
Observed vegetation: Annual grasses and forbs and, in riparian areas, cottonwood, California sycamore, valley oak, black walnut, California grape, and willows
Texture of the surface layer: Gravelly loamy sand
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Natural hydrology has been significantly altered. Sediment pulses were released into drainageways during hydraulic mining activities. These sediments quickly filled in natural channels and built up on the flood plain. Levees constructed on the flood plain were intended to confine the mine sediments. Some levees were breached, and natural channels are becoming reestablished.
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 20 to 94 inches
- *Available water capacity:* Moderate (about 5.7 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 2s-4
- *Land capability, nonirrigated:* 3s-4
- *Storie index:* 46 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile
- A—0 to 3 inches; gravelly loamy sand
- C1—3 to 11 inches; gravelly coarse sandy loam
- C2—11 to 20 inches; gravelly coarse sandy loam

C3—20 to 24 inches; sand
C4—24 to 31 inches; gravelly sand
C5—31 to 45 inches; silt loam
C6—45 to 51 inches; gravelly sand
C7—51 to 66 inches; silt
C8—66 to 84 inches; very gravelly coarse sand
C9—84 to 95 inches; extremely gravelly coarse sand

Characteristics of Typic Xerofluvents, Sandy-Skeletal

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Sandy and gravelly alluvium generated from hydraulic mines and derived from sedimentary rocks
Observed vegetation: Annual grasses and forbs and, in riparian areas, cottonwood, California sycamore, valley oak, black walnut, California grape, and willows
Texture of the surface layer: Gravelly loamy coarse sand
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Natural hydrology has been significantly altered. Sediment pulses were released into drainageways during hydraulic mining activities. These sediments quickly filled in natural channels and built up on the flood plain. Levees constructed on the flood plain were intended to confine the mine sediments. Some levees were breached, and natural channels are becoming reestablished.
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 20 to 98 inches
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 7s-4
Land capability, nonirrigated: 7s-4
Storie index: 46 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
A—0 to 3 inches; gravelly loamy coarse sand
C1—3 to 9 inches; very gravelly loamy coarse sand
C2—9 to 16 inches; very gravelly coarse sand
C3—16 to 22 inches; very gravelly coarse sand
C4—22 to 30 inches; very gravelly coarse sand
C5—30 to 40 inches; very gravelly coarse sand
C6—40 to 50 inches; gravelly sand
C7—50 to 98 inches; extremely gravelly coarse sand

Minor Components in Map Unit 360

Typic Xerofluvents, sandy, and similar soils
Composition: 9 percent
Slope: 0 to 2 percent

Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Soils that have a loamy-skeletal substratum
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Soils that have a clayey buried substratum
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

361—Typic Xerofluvents, sandy-skeletal, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Source of aggregate, wildlife habitat, watershed, and livestock grazing
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 360 to 600 feet (110 to 183 meters)
Mean annual precipitation: 30 to 35 inches (762 to 889 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 258 to 260 days

Map Unit Composition

Typic Xerofluvents, sandy-skeletal—85 percent
Minor components—15 percent

Characteristics of Typic Xerofluvents, Sandy-Skeletal

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Sandy and gravelly alluvium generated from hydraulic mines and derived from sedimentary rocks
Observed vegetation: Annual grasses and forbs and, in riparian areas, cottonwood, California sycamore, valley oak, black walnut, California grape, and willows
Texture of the surface layer: Gravelly loamy coarse sand
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Natural hydrology has been significantly altered. Sediment pulses were released into drainageways during hydraulic mining activities. These sediments quickly filled in natural channels and built up on the flood plain. Levees constructed on the flood plain were intended to confine the mine sediments. Some levees were breached, and natural channels are becoming reestablished.
Annual flooding frequency: Rare
Annual ponding frequency: None

Depth to a water table (zone of saturation): 20 to 98 inches
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 7s-4
Land capability, nonirrigated: 7s-4
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
A—0 to 3 inches; gravelly loamy coarse sand
C1—3 to 9 inches; very gravelly loamy coarse sand
C2—9 to 16 inches; very gravelly coarse sand
C3—16 to 22 inches; very gravelly coarse sand
C4—22 to 30 inches; very gravelly coarse sand
C5—30 to 40 inches; very gravelly coarse sand
C6—40 to 50 inches; gravelly sand
C7—50 to 98 inches; extremely gravelly coarse sand

Minor Components in Map Unit 361

Typic Xerofluvents, coarse-loamy, and similar soils
Composition: 9 percent
Slope: 0 to 2 percent
Geomorphic position: Areas of hydraulic-mine sediment on stream terraces
Hydric soil status: Not hydric

Soils that have a loamy-skeletal substratum
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Areas of hydraulic-mine sediment on stream terraces
Hydric soil status: Not hydric

Soils that have a clayey buried substratum
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Areas of hydraulic-mine sediment on stream terraces
Hydric soil status: Not hydric

362—Ultic Haploxeralfs, sandstone, low elevation, complex, 2 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 295 to 495 feet (91 to 152 meters)
Mean annual precipitation: 28 to 32 inches (711 to 813 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Ultic Haploxeralfs, sandstone, low elevation, very deep—60 percent

Ultic Haploxeralfs, sandstone, low elevation, deep—25 percent
Minor components—15 percent

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Very Deep

Slope: 2 to 5 percent
Geomorphic position: Footslopes on hills
Parent material: Fine-loamy residuum weathered from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 90 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; sandy loam
Bt1—2 to 8 inches; sandy clay loam
Bt2—8 to 18 inches; sandy clay loam
Bt3—18 to 28 inches; sandy clay loam
Bt4—28 to 39 inches; sandy clay loam
BCt—39 to 49 inches; sandy clay loam
C1—49 to 56 inches; sandy clay loam
C2—56 to 70 inches; sandy loam

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Deep

Slope: 2 to 5 percent
Geomorphic position: Convex footslopes on hills
Parent material: Fine-loamy residuum weathered from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.0 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 8 inches; sandy clay loam
Bt2—8 to 15 inches; sandy clay loam
BCt1—15 to 24 inches; fine sandy loam
BCt2—24 to 32 inches; loam
BCt3—32 to 41 inches; very fine sandy loam
Cr—41 inches; bedrock

Minor Components in Map Unit 362

Redsluff taxadjunct and similar soils
Composition: 4 percent
Slope: 2 to 3 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Palexerults and similar soils
Composition: 4 percent
Slope: 2 to 5 percent
Geomorphic position: Footslopes on sedimentary hills
Hydric soil status: Not hydric

Ultic Haploxeralfs, fine, and similar soils
Composition: 3 percent
Slope: 2 to 5 percent
Geomorphic position: Footslopes on sedimentary hills
Hydric soil status: Not hydric

Carhart and similar soils
Composition: 2 percent
Slope: 2 to 5 percent
Geomorphic position: Footslopes on sedimentary hills
Hydric soil status: Hydric

Ultic Haploxeralfs with paralithic bedrock at a depth of 20 to 40 inches and similar soils
Composition: 1 percent
Slope: 2 to 5 percent
Geomorphic position: Convex footslopes on sedimentary hills
Hydric soil status: Not hydric

Seeps
Composition: 1 percent
Slope: 2 to 5 percent
Geomorphic position: Footslopes on sedimentary hills
Hydric soil status: Hydric

363—Ultic Haploxeralfs, sandstone, low elevation, complex, 5 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 340 to 635 feet (104 to 195 meters)
Mean annual precipitation: 28 to 32 inches (711 to 813 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Ultic Haploxeralfs, sandstone, low elevation, very deep—60 percent
Ultic Haploxeralfs, sandstone, low elevation, deep—30 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Very Deep

Slope: 5 to 15 percent
Geomorphic position: Side slopes on hills
Parent material: Fine-loamy residuum weathered from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 90 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; sandy loam
Bt1—2 to 8 inches; sandy clay loam
Bt2—8 to 18 inches; sandy clay loam
Bt3—18 to 28 inches; sandy clay loam
Bt4—28 to 39 inches; sandy clay loam
BCt—39 to 49 inches; sandy clay loam
C1—49 to 56 inches; sandy clay loam
C2—56 to 70 inches; sandy loam

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Deep

Slope: 5 to 15 percent
Geomorphic position: Nose slopes on hills
Parent material: Fine-loamy residuum weathered from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 8 inches; sandy clay loam
Bt2—8 to 15 inches; sandy clay loam
BCt1—15 to 24 inches; fine sandy loam
BCt2—24 to 32 inches; loam
BCt3—32 to 41 inches; very fine sandy loam
Cr—41 inches; bedrock

Minor Components in Map Unit 363

Palexerults and similar soils
Composition: 3 percent
Slope: 5 to 15 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Not hydric

Ultic Haploxeralfs, fine, and similar soils
Composition: 2 percent
Slope: 5 to 15 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Not hydric

Carhart and similar soils
Composition: 2 percent
Slope: 5 to 15 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Hydric

Ultic Haploxeralfs with paralithic bedrock at a depth of 20 to 40 inches and similar soils
Composition: 2 percent
Slope: 5 to 15 percent

Geomorphic position: Nose slopes on sedimentary hills
Hydric soil status: Not hydric

Seeps
Composition: 1 percent
Slope: 5 to 15 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Hydric

364—Ultic Haploxeralfs, sandstone, low elevation, complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 340 to 620 feet (104 to 189 meters)
Mean annual precipitation: 28 to 32 inches (711 to 813 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Ultic Haploxeralfs, sandstone, low elevation, deep—50 percent
Ultic Haploxeralfs, sandstone, low elevation, very deep—40 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Deep

Slope: 15 to 30 percent
Geomorphic position: Nose slopes on hills
Parent material: Fine-loamy residuum weathered from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 8 inches; sandy clay loam

Bt2—8 to 15 inches; sandy clay loam
BCt1—15 to 24 inches; fine sandy loam
BCt2—24 to 32 inches; loam
BCt3—32 to 41 inches; very fine sandy loam
Cr—41 inches; bedrock

Characteristics of Ultic Haploxeralfs, Sandstone, Low Elevation, Very Deep

Slope: 15 to 30 percent
Geomorphic position: Side slopes on hills
Parent material: Fine-loamy colluvium derived from sandstone
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent well rounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 90 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; sandy loam
Bt1—2 to 8 inches; sandy clay loam
Bt2—8 to 18 inches; sandy clay loam
Bt3—18 to 28 inches; sandy clay loam
Bt4—28 to 39 inches; sandy clay loam
BCt—39 to 49 inches; sandy clay loam
C1—49 to 56 inches; sandy clay loam
C2—56 to 70 inches; sandy loam

Minor Components in Map Unit 364

Ultic Haploxeralfs with paralithic bedrock at a depth of 20 to 40 inches and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Nose slopes on sedimentary hills
Hydric soil status: Not hydric

Palexerults and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Not hydric

Ultic Haploxeralfs, fine, and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Not hydric

Carhart and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Hydric

Seeps
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on sedimentary hills
Hydric soil status: Hydric

365—Palexerults, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 225 to 1,380 feet (70 to 422 meters)
Mean annual precipitation: 26 to 40 inches (660 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Palexerults gravelly loam—80 percent
Minor components—20 percent

Characteristics of Palexerults Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Parent material: Fine-loamy colluvium derived from volcanic and sedimentary rocks over clayey residuum weathered from claystone
Observed vegetation: Annual grasses and forbs; oaks, buckbrush, and manzanita at the higher elevations
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent rounded cobbles, 0 to 5 percent angular stones, 0 to 3 percent angular boulders, 0 to 20 percent medium, rounded gravel
Depth to a restrictive feature (densic bedrock): 60 to 90 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 12 inches; gravelly loam
Bt2—12 to 20 inches; clay loam
2Bt3—20 to 29 inches; silty clay
2BCt—29 to 46 inches; silty clay
2C—46 to 65 inches; silty clay
2Cd—65 inches; bedrock

Minor Components in Map Unit 365

Palexerults, clayey-skeletal, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Not hydric

Coalcanyon very cobbly loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, low elevation, and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Not hydric

Seeps
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Hydric

Carhart and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Hydric

Chinacamp and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes and backslopes on hills
Hydric soil status: Not hydric

366—Palexerults, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 455 to 1,400 feet (140 to 427 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Palexerults gravelly loam—80 percent
Minor components—20 percent

Characteristics of Palexerults Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Parent material: Fine-loamy colluvium derived from volcanic and sedimentary rocks over clayey residuum weathered from claystone
Observed vegetation: Annual grasses and forbs; oaks, buckbrush, and manzanita at the higher elevations
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent rounded cobbles, 0 to 5 percent angular stones, 0 to 3 percent angular boulders, 0 to 20 percent medium, rounded gravel
Depth to a restrictive feature (densic bedrock): 60 to 90 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 12 inches; gravelly loam
Bt2—12 to 20 inches; clay loam
2Bt3—20 to 29 inches; silty clay
2BCt—29 to 46 inches; silty clay
2C—46 to 65 inches; silty clay
2Cd—65 inches; bedrock

Minor Components in Map Unit 366

Palexerults, clayey-skeletal, and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Not hydric

Coalcanyon very cobbly loam and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, low elevation, and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Not hydric

Seeps
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Hydric

Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Hydric

Chinacamp and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on hills
Hydric soil status: Not hydric

370—Palexerults, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 170 to 1,200 feet (53 to 366 meters)
Mean annual precipitation: 26 to 40 inches (660 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Palexerults gravelly loam—80 percent
Minor components—20 percent

Characteristics of Palexerults Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills
Parent material: Fine-loamy colluvium derived from volcanic and sedimentary rocks over clayey residuum weathered from claystone
Observed vegetation: Annual grasses and forbs; oaks, buckbrush, and manzanita at the higher elevations
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent rounded cobbles, 0 to 5 percent angular stones, 0 to 3 percent angular boulders, 0 to 20 percent medium, rounded gravel
Depth to a restrictive feature (densic bedrock): 60 to 90 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 12 inches; gravelly loam
Bt2—12 to 20 inches; clay loam
2Bt3—20 to 29 inches; silty clay
2BCt—29 to 46 inches; silty clay
2C—46 to 65 inches; silty clay
2Cd—65 inches; densic bedrock

Minor Components in Map Unit 370

Palexerults, clayey-skeletal, and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills
Hydric soil status: Not hydric

Cherokeespring and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills
Hydric soil status: Not hydric

Coalcanyon very cobbly loam and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills

Geomorphic position: Footslopes on hills
Hydric soil status: Hydric

Wickscorner and similar soils
Composition: 2 percent
Slope: 2 to 10 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, low elevation, and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes on hills
Hydric soil status: Not hydric

375—Wickscorner loam, 2 to 10 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, orchard crops, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 245 to 655 feet (76 to 201 meters)
Mean annual precipitation: 24 to 29 inches (610 to 737 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Wickscorner loam—80 percent
Minor components—20 percent

Characteristics of Wickscorner Loam

Slope: 2 to 10 percent
Geomorphic position: Alluvial fans on Table Mountain
Parent material: Loamy alluvium over gravelly and clayey alluvium derived from basalt
Observed vegetation: Annual grasses and forbs and olive orchards
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 15 percent subrounded cobbles

Depth to a restrictive feature (duripan): 60 to 87 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 50 to 84 inches
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 3e-1
Storie index: 83 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; loam
Bt2—8 to 22 inches; gravelly clay loam
2Bt3—22 to 38 inches; very gravelly clay loam
2Bt4—38 to 59 inches; very gravelly clay
3Bt5—59 to 72 inches; extremely gravelly sandy clay
3Bt6—72 to 84 inches; extremely gravelly sandy clay

Minor Components in Map Unit 375

Flagcanyon gravelly loam and similar soils
Composition: 8 percent
Slope: 2 to 10 percent
Geomorphic position: Alluvial fans on Table Mountain
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to a duripan
Composition: 5 percent
Slope: 2 to 10 percent
Geomorphic position: Convex slopes on alluvial fans on Table Mountain
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to a duripan
Composition: 5 percent
Slope: 2 to 10 percent
Geomorphic position: Convex slopes on alluvial fans on Table Mountain
Hydric soil status: Not hydric

Soils that are fine-loamy throughout and are more than 60 inches deep to a duripan
Composition: 2 percent
Slope: 2 to 10 percent
Geomorphic position: Large mounds on fan terraces
Hydric soil status: Not hydric

376—Flagcanyon-Wickscorner complex, 2 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, orchard crops, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 215 to 495 feet (67 to 152 meters)
Mean annual precipitation: 25 to 30 inches (635 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Flagcanyon gravelly loam—50 percent
Wickscorner loam—35 percent
Minor components—15 percent

Characteristics of Flagcanyon Gravelly Loam

Slope: 2 to 5 percent
Geomorphic position: Alluvial fans on Table Mountain
Parent material: Loamy and gravelly alluvium over cemented, clayey, and extremely gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs and olive orchards
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 0 to 15 percent subangular cobbles
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 16 to 40 inches
- *Available water capacity:* Low (about 2.7 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-3
- *Land capability, nonirrigated:* 3e-3
- *Storie index:* 43 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 3 inches; gravelly loam
- Bt1—3 to 9 inches; very gravelly loam
- Bt2—9 to 14 inches; very gravelly loam
- 2Bt3—14 to 30 inches; very gravelly clay loam
- 3Btq1—30 to 53 inches; extremely gravelly duripan
- 3Btq2—53 to 65 inches; extremely gravelly duripan

Characteristics of Wickscorner Loam

Slope: 2 to 5 percent
Geomorphic position: Alluvial fans on Table Mountain
Parent material: Loamy alluvium over gravelly and clayey alluvium derived from basalt
Observed vegetation: Annual grasses and forbs and olive orchards
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 5 percent subrounded cobbles
Depth to a restrictive feature (duripan): 60 to 84 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 50 to 84 inches
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 3e-1
Storie index: 86 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; loam
Bt2—8 to 22 inches; gravelly clay loam
2Bt3—22 to 38 inches; very gravelly clay loam
2Bt4—38 to 59 inches; very gravelly clay
3Bt5—59 to 72 inches; extremely gravelly sandy clay
3Bt6—72 to 84 inches; extremely gravelly sandy clay

Minor Components in Map Unit 376

Clayey-skeletal soils that are 20 to 40 inches deep
Composition: 5 percent
Slope: 2 to 5 percent
Geomorphic position: Areas along drainageways on alluvial fans on Table Mountain
Hydric soil status: Not hydric

Soils that are fine-loamy throughout and are more than 60 inches deep to a duripan
Composition: 3 percent
Slope: 2 to 5 percent
Geomorphic position: Mounds on fan terraces on Table Mountain
Hydric soil status: Not hydric

Near irrigated areas, soils that have a high water table
Composition: 3 percent
Slope: 2 to 5 percent
Geomorphic position: Alluvial fans on Table Mountain
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to a duripan
Composition: 2 percent

Slope: 2 to 5 percent
Geomorphic position: Fan terraces on Table Mountain
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 2 to 3 percent
Geomorphic position: Open depressions on fan terraces on Table Mountain
Hydric soil status: Hydric

377—Flagcanyon taxadjunct-Durixeralfs-Duraquerts complex, 0 to 5 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing and wildlife habitat
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 380 feet (44 to 116 meters)
Mean annual precipitation: 25 to 27 inches (635 to 686 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Flagcanyon taxadjunct fine sandy loam—55 percent
Durixeralfs, clayey-skeletal, loam—20 percent
Duraquerts gravelly clay—15 percent
Minor components—10 percent

Characteristics of Flagcanyon Taxadjunct Fine Sandy Loam

Slope: 0 to 5 percent
Geomorphic position: Mounds on fan terraces on Table Mountain
Parent material: Fine-loamy alluvium over clayey and very gravelly alluvium over cemented, sandy, and extremely gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, well rounded gravel
Depth to a restrictive feature: 20 to 40 inches to a duripan; 40 to 60 inches to an indurated duripan
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 16 to 40 inches
Available water capacity: Low (about 3.7 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3

Storie index: 48 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 7 inches; loam
Bt2—7 to 16 inches; clay loam
2Bt3—16 to 23 inches; very gravelly clay
2Bt4—23 to 31 inches; extremely gravelly clay
3Bq—31 to 63 inches; extremely gravelly duripan

Characteristics of Durixeralfs, Clayey-Skeletal, Loam

Slope: 0 to 5 percent
Geomorphic position: Swales on fan terraces on Table Mountain
Parent material: Loamy alluvium over clayey and very gravelly alluvium over cemented, extremely gravelly alluvium derived from basalt
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, rounded gravel, 2 to 20 percent rounded cobbles, 0 to 1 percent rounded stones
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-2
Land capability, nonirrigated: 6e-2
Storie index: 34 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; loam
Bt1—1 to 4 inches; clay loam
2Bt2—4 to 9 inches; very gravelly clay
2Bt3—9 to 15 inches; very gravelly clay
3Bq—15 to 60 inches; extremely gravelly duripan

Characteristics of Duraquerts Gravelly Clay

Slope: 0 to 1 percent
Geomorphic position: Swales on fan terraces on Table Mountain
Parent material: Clayey and gravelly alluvium over cemented, very gravelly, and sandy alluvium derived from igneous, sedimentary, and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Surface feature: Polygonal cracks open during dry periods.
Texture of the surface layer: Gravelly clay
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, well rounded gravel, 2 to 25 percent well rounded cobbles

Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 3.0 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 11 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; gravelly clay
A2—3 to 6 inches; gravelly silty clay
Bss1—6 to 15 inches; silty clay
Bss2—15 to 21 inches; silty clay
Bw—21 to 23 inches; very gravelly silty clay
2Bq—23 to 60 inches; very gravelly duripan

Minor Components in Map Unit 377

Typic Petraquepts and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on fan terraces on Table Mountain
Hydric soil status: Hydric

Clayey-skeletal soils that are 20 to 40 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on fan terraces on Table Mountain
Hydric soil status: Hydric

Soils that have an indurated duripan
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Fan terraces on Table Mountain
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Mounds on fan terraces on Table Mountain
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on fan terraces on Table Mountain
Hydric soil status: Hydric

400—Subaco taxadjunct clay, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County and north-central Sutter County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 75 feet (20 to 23 meters)
Mean annual precipitation: 19 to 21 inches (483 to 533 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Subaco taxadjunct clay—85 percent
Minor components—15 percent

Characteristics of Subaco Taxadjunct Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, fine-silty alluvium over dense, sandy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature: 20 to 40 inches to a duripan; 40 to 60 inches to dense material
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Moderate (about 5.3 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 15 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 8 inches; clay
- Bss—8 to 16 inches; silty clay
- Bkss—16 to 29 inches; silty clay
- Bk—29 to 35 inches; clay

2Bkqm—35 to 42 inches; duripan
2Cd—42 to 60 inches; dense sandy loam

Minor Components in Map Unit 400

Neerdobe clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon clay and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Gridley taxadjunct clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Saline soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

415—Ignord fine sandy loam, 0 to 2 percent slopes

Map Unit Setting

General location: West-central Butte County
Major uses: Orchard crops, row crops, and grain crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 155 feet (35 to 48 meters)
Mean annual precipitation: 20 to 22 inches (508 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Ignord fine sandy loam—90 percent
Minor components—10 percent

Characteristics of Ignord Fine Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Wave-worked distal alluvial fans
Parent material: Coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks

Observed vegetation: Almond and walnut orchards, wheat, and valley oak
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2s-6
Land capability, nonirrigated: 3s-6
Storie index: 85 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Akp—0 to 4 inches; fine sandy loam
Ak1—4 to 14 inches; fine sandy loam
Ak2—14 to 25 inches; sandy loam
Ak3—25 to 32 inches; fine sandy loam
Bk—32 to 53 inches; sandy loam
Bkq—53 to 58 inches; fine sandy loam
B´k—58 to 77 inches; fine sandy loam

Minor Components in Map Unit 415

Vina fine sandy loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Almendra and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that have 1 to 15 percent gravel throughout
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Wave-worked distal alluvial fans
Hydric soil status: Not hydric

Bosquejo clay and similar soils
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

416—Calcic Haploxerolls, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County
Major uses: Irrigated cropland, irrigated pasture, homesite development, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 65 to 85 feet (20 to 27 meters)
Mean annual precipitation: 18 to 19 inches (457 to 483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Calcic Haploxerolls sandy loam—90 percent
Minor components—10 percent

Characteristics of Calcic Haploxerolls Sandy Loam

Slope: 0 to 1 percent
Geomorphic position: Low terraces
Parent material: Coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Annual grasses and forbs and rice
Surface feature: Some areas have been leveled for agriculture.
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Hydrology has been altered in areas leveled for agriculture.
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 11 to 60 inches
- *Available water capacity:* Moderate (about 5.6 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 3s-6
- *Land capability, nonirrigated:* 3s-6
- *Storie index:* 67 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 5 inches; sandy loam
- Ak—5 to 17 inches; sandy loam
- Bk1—17 to 20 inches; sandy loam
- Bk2—20 to 33 inches; sandy loam
- C—33 to 44 inches; sandy loam
- 2Cd—44 to 72 inches; dense material

Minor Components in Map Unit 416

Calcic Haploxerolls that are loam throughout and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Calcic Haploxerolls clay loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Low terraces
Hydric soil status: Not hydric

418—Almendra loam, 0 to 1 percent slopes

Map Unit Setting

General location: West-central Butte County
Major uses: Orchard crops, row crops, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 225 feet (35 to 70 meters)
Mean annual precipitation: 20 to 26 inches (508 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Almendra loam—85 percent
Minor components—15 percent

Characteristics of Almendra Loam

Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Parent material: Loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond, walnut, and kiwi orchards, beans, small grain crops, and valley oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.4 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 1
Land capability, nonirrigated: 3c-1
Storie index: 94 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap1—0 to 4 inches; loam
Ap2—4 to 14 inches; loam
Bw1—14 to 29 inches; loam
Bw2—29 to 40 inches; loam
Bw3—40 to 52 inches; loam
Bw4—52 to 74 inches; very fine sandy loam
Bw5—74 to 86 inches; very fine sandy loam

Minor Components in Map Unit 418

Conejo clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Soils that have a water table at a depth of 30 to 72 inches
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Filled channels on alluvial fans
Hydric soil status: Not hydric

Soils that have weakly cemented material below a depth of 40 inches
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Vina fine sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Charger and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Chico and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

419—Conejo fine sandy loam, 0 to 1 percent slopes, overwash

Map Unit Setting

General location: West-central Butte County
Major uses: Orchard crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 180 feet (43 to 56 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Conejo fine sandy loam, overwash—85 percent
Minor components—15 percent

Characteristics of Conejo Fine Sandy Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Parent material: Coarse-loamy alluvium derived from igneous and metamorphic rocks over fine-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards and valley oak
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very high (about 10.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 1
- *Land capability, nonirrigated:* 3c-1
- *Storie index:* 89 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Ap—0 to 17 inches; fine sandy loam
- Ab—17 to 35 inches; clay loam
- A/B—35 to 45 inches; clay loam
- Bw1—45 to 56 inches; clay loam
- Bw2—56 to 62 inches; loam
- Bw3—62 to 70 inches; loam
- Bw4—70 to 72 inches; loam

Minor Components in Map Unit 419

Almendra loam and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Charger and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that have a water table at a depth of 30 to 72 inches
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Filled channels on alluvial fans
Hydric soil status: Not hydric

Typic Xerofluvents, coarse-loamy, and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

420—Conejo clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: West-central Butte County
Major uses: Orchard crops, row crops, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 180 feet (34 to 56 meters)
Mean annual precipitation: 20 to 24 inches (508 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Conejo clay loam—85 percent
Minor components—15 percent

Characteristics of Conejo Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Parent material: Fine-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards, beans, and valley oak
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Clay loam

Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 11.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 1
Land capability, nonirrigated: 3c-1
Storie index: 85 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 5 inches; clay loam
A1—5 to 19 inches; clay loam
A2—19 to 30 inches; clay loam
Bw1—30 to 48 inches; clay loam
Bw2—48 to 70 inches; sandy loam

Minor Components in Map Unit 420

Almendra and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Busacca and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Soils that have a water table at a depth of 30 to 72 inches
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Filled channels on alluvial fans
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to weakly cemented material
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Edjobe and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Bosquejo clay and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

425—Vina fine sandy loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Orchard crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 235 feet (43 to 72 meters)
Mean annual precipitation: 22 to 25 inches (559 to 635 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Vina fine sandy loam—85 percent
Minor components—15 percent

Characteristics of Vina Fine Sandy Loam

Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Parent material: Coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards and valley oak
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 2s-11
Land capability, nonirrigated: 3c-11
Storie index: 85 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap1—0 to 3 inches; fine sandy loam
Ap2—3 to 11 inches; fine sandy loam
A1—11 to 23 inches; sandy loam
A2—23 to 37 inches; sandy loam
C1—37 to 50 inches; sandy loam

C2—50 to 54 inches; loamy coarse sand
C3—54 to 80 inches; coarse sand

Minor Components in Map Unit 425

Almendra and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Charger and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Redsluff and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Soils that have a water table at a depth of 40 to 80 inches
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Areas along stream channels on alluvial fans
Hydric soil status: Not hydric

Xerofluvents and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

426—Vina loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Orchard crops and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 160 to 205 feet (49 to 63 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Vina loam—85 percent
Minor components—15 percent

Characteristics of Vina Loam

Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Parent material: Coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks

Observed vegetation: Almond and walnut orchards and valley oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 1
Land capability, nonirrigated: 3c-1
Storie index: 93 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 4 inches; loam
A1—4 to 15 inches; loam
A2—15 to 28 inches; loam
A3—28 to 44 inches; loam
A4—44 to 63 inches; loam
Bw—63 to 72 inches; loam

Minor Components in Map Unit 426

Vina fine sandy loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Almendra and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Charger and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Ignord and similar soils
Composition: 1 percent
Slope: 0 to 1 percent

Geomorphic position: Wave-worked distal alluvial fans
Hydric soil status: Not hydric

439—Oxyaquic Xerofluvents clay, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 45 to 60 feet (15 to 19 meters)
Mean annual precipitation: 18 inches (457 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Oxyaquic Xerofluvents clay—85 percent
Minor components—15 percent

Characteristics of Oxyaquic Xerofluvents Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty and clayey alluvium generated from hydraulic mines and derived from sedimentary rocks over clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, annual grasses and forbs, tules, willows, cottonwood, and scattered valley oak
Surface feature: The natural soil surface has been buried by hydraulic-mine sediment.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 24 to 80 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Hydrology has been altered by a drainage canal constructed to protect farmland and to carry hydraulic-mine sediment from the Cherokee Gold Mine.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 18 to 80 inches
- *Available water capacity:* High (about 8.7 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 24 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 10 inches; clay

C1—10 to 13 inches; silty clay
C2—13 to 21 inches; silty clay
C3—21 to 27 inches; silt loam
C4—27 to 32 inches; silty clay
C5—32 to 37 inches; silty clay loam
Ab—37 to 55 inches; clay
Bssb—55 to 63 inches; clay
Bqmb—63 to 65 inches; duripan
Bqb—65 to 80 inches; clay

Minor Components in Map Unit 439

Clear Lake clay, frequently flooded, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Oxyaquic Xerofluvents, fine-loamy, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Oxyaquic Xerofluvents, fine-silty, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that have overwash less than 20 inches thick
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are less than 40 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are less than 40 inches deep to buried basin clay
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

440—Oxyaquic Xerofluvents silt loam, 0 to 1 percent slopes, frequently flooded

Map Unit Setting

General location: Southwestern and central Butte County
Major uses: Wildlife habitat, borrow pits, and flood retention
Major land resource area: 17
Landscape: Sacramento Valley

Elevation: 65 to 100 feet (20 to 31 meters)
Mean annual precipitation: 18 to 20 inches (457 to 508 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Oxyaquic Xerofluvents silt loam, frequently flooded—80 percent
Minor components—20 percent

Characteristics of Oxyaquic Xerofluvents Silt Loam, Frequently Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood plains within levees on flood basins and stream terraces
Parent material: Fine-loamy alluvium generated from hydraulic mines and derived from sedimentary rocks over clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Willows, cottonwood, valley oak, and annual grasses and forbs
Surface feature: Hydraulic-mine sediment deposited within the confines of artificial levees
Texture of the surface layer: Stratified silt loam to very fine sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 24 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Hydrology has been altered by a drainage canal constructed to protect farmland and to carry hydraulic-mine sediment from the Cherokee Gold Mine.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Rare
- *Depth to a water table (zone of saturation):* 24 to 80 inches
- *Available water capacity:* High (about 8.4 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 4w-2
- *Land capability, nonirrigated:* 4w-2
- *Storie index:* 58 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 9 inches; stratified silt loam to very fine sandy loam
- C1—9 to 18 inches; fine sand
- C2—18 to 25 inches; stratified silt loam to very fine sandy loam
- C3—25 to 33 inches; stratified silt loam to fine sand
- C4—33 to 44 inches; stratified silty clay loam to loam
- C5—44 to 51 inches; stratified silt loam to silty clay loam
- 2Bssb—51 to 60 inches; clay

Minor Components in Map Unit 440

Clear Lake, overwash, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon, overwash, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Typic Xerofluvents and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains
Hydric soil status: Hydric

Riverwash
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

Soils that are less than 10 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

441—Oxyaquic Xerofluvents very fine sandy loam, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 120 feet (35 to 38 meters)
Mean annual precipitation: 21 inches (533 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 245 days

Map Unit Composition

Oxyaquic Xerofluvents very fine sandy loam—90 percent
Minor components—10 percent

Characteristics of Oxyaquic Xerofluvents Very Fine Sandy Loam

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Fine-loamy alluvium generated from hydraulic mines and derived from sedimentary rocks over clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice
Surface feature: The natural soil surface has been buried by hydraulic-mine sediment.
Texture of the surface layer: Very fine sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 24 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Levees and leveling for agriculture have altered the hydrology, modifying the frequency and duration of saturation, ponding, and flooding.
Annual flooding frequency: Rare
Annual ponding frequency: Rare
Depth to a water table (zone of saturation): 24 to 80 inches
Available water capacity: Very high (about 10.2 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 3w-2
Land capability, nonirrigated: 3w-2
Storie index: 70 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 6 inches; very fine sandy loam
C1—6 to 20 inches; silt loam
C2—20 to 30 inches; silt loam
C3—30 to 43 inches; stratified loamy fine sand to silt loam
C4—43 to 55 inches; silt loam
C5—55 to 72 inches; stratified loamy fine sand to silt loam
2Ab—72 to 75 inches; clay

Minor Components in Map Unit 441

Blavo clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon, overwash, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Oxyaquic Xerofluvents, fine, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to buried basin clay
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

Human-transported fill from dredged materials
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to a duripan
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Not hydric

442—Durixerolls-Haploxerolls clay loams, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Irrigated crops, pasture, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 190 feet (43 to 58 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Durixerolls clay loam—55 percent
Haploxerolls clay loam, deep—30 percent
Minor components—15 percent

Characteristics of Durixerolls Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Almond and prune orchards, wheat, hay, beans, and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 12 to 40 inches
Available water capacity: Moderate (about 6.6 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 45 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 6 inches; clay loam
Bw1—6 to 12 inches; clay loam

Bw2—12 to 24 inches; clay loam
Bw3—24 to 33 inches; clay loam
2Bqm—33 inches; duripan

Characteristics of Haploxerolls Clay Loam, Deep

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Almond and prune orchards, wheat, hay, beans, and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 20 to 60 inches
Available water capacity: Very high (about 10.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3s-2
Land capability, nonirrigated: 3s-2
Storie index: 76 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 5 inches; clay loam
Bw1—5 to 18 inches; clay loam
Bw2—18 to 29 inches; loam
Bw3—29 to 44 inches; loam
Bw4—44 to 57 inches; loam
2Bqm—57 inches; duripan

Minor Components in Map Unit 442

Haploxerolls loam, 40 to 60 inches deep, and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Almendra loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Anita clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Small basins on fan terraces
Hydric soil status: Hydric

Bosquejo clay and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Interfan basins
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Galt clay loam and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Small basins on fan terraces
Hydric soil status: Hydric

Loamy soils that are 0 to 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

443—Durixerolls-Haploxerolls loams, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Irrigated crops, pasture, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 190 feet (44 to 58 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Durixerolls loam—60 percent
Haploxerolls loam, deep—25 percent
Minor components—15 percent

Characteristics of Durixerolls Loam

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Almond, walnut, and prune orchards, wheat, beans, and valley oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 12 to 40 inches
Available water capacity: Low (about 4.5 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 40 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap—0 to 4 inches; loam
Bw1—4 to 10 inches; loam
Bw2—10 to 17 inches; loam
Bw3—17 to 23 inches; loam
Bw4—23 to 26 inches; loam
2Bqm—26 inches; duripan

Characteristics of Haploxerolls Loam, Deep

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium over cemented, loamy alluvium derived from volcanic rocks
Observed vegetation: Almond, walnut, and prune orchards, wheat, beans, and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 20 to 60 inches
Available water capacity: High (about 8.7 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3s-2
Land capability, nonirrigated: 3s-2
Storie index: 84 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 5 inches; loam
Ap2—5 to 16 inches; loam
Bw1—16 to 27 inches; loam
Bw2—27 to 40 inches; loam
Bw3—40 to 48 inches; loam

Bw4—48 to 52 inches; sandy loam
2Bqm—52 inches; duripan

Minor Components in Map Unit 443

Haploxerolls clay loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Galt clay loam and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Small basins on fan terraces
Hydric soil status: Hydric

Busacca clay loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Altered soils that have been ripped or consist of fill
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

445—Chico loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Orchard crops, row crops, pasture, and residential, commercial, and industrial development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 225 feet (43 to 69 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Chico loam—85 percent
Minor components—15 percent

Characteristics of Chico Loam

Slope: 0 to 2 percent
Geomorphic position: Low fan terraces

Parent material: Loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond and walnut orchards, annual grasses and forbs, and valley oak
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 72 to 80 inches
Available water capacity: Very high (about 11.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Negligible

Interpretive groups
Land capability, irrigated: 1
Land capability, nonirrigated: 3c-1
Storie index: 94 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 5 inches; loam
Bt1—5 to 10 inches; clay loam
Bt2—10 to 21 inches; clay loam
Bt3—21 to 32 inches; clay loam
Bt4—32 to 50 inches; loam
Bt5—50 to 70 inches; loam
Bt6—70 to 80 inches; loam

Minor Components in Map Unit 445

Redsluff and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

Almendra and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Vina fine sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 2 percent

Geomorphic position: Inset fans
Hydric soil status: Not hydric

447—Charger fine sandy loam, 0 to 1 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Homesite development, irrigated crops, livestock grazing, riparian forest, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 180 to 600 feet (56 to 183 meters)
Mean annual precipitation: 24 to 28 inches (610 to 711 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Charger fine sandy loam—80 percent
Minor components—20 percent

Characteristics of Charger Fine Sandy Loam

Slope: 0 to 2 percent
Geomorphic position: Proximal alluvial fans
Parent material: Coarse-loamy alluvium derived from igneous, metamorphic, and sedimentary rocks over gravelly alluvium derived from volcanic and metamorphic rocks
Observed vegetation: Walnut and almond orchards, cottonwood, willows, valley oak, and annual grasses and forbs
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 15 percent medium, rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 40 to 80 inches
- *Available water capacity:* Moderate (about 7.2 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 2s-11
- *Land capability, nonirrigated:* 3s-11
- *Storie index:* 84 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Ap—0 to 3 inches; fine sandy loam
- A1—3 to 7 inches; fine sandy loam
- A2—7 to 15 inches; fine sandy loam
- Bw1—15 to 32 inches; sandy loam
- Bw2—32 to 42 inches; sandy loam

Bw3—42 to 53 inches; sandy loam
Bw4—53 to 63 inches; sandy loam
C—63 to 80 inches; extremely gravelly loamy coarse sand

Minor Components in Map Unit 447

Vina fine sandy loam and similar soils
Composition: 8 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Redsluff and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

Almendra and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Loamy-skeletal soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Proximal alluvial fans
Hydric soil status: Not hydric

Sandy-skeletal soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Proximal alluvial fans
Hydric soil status: Not hydric

Wafap and similar soils
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Low stream terraces
Hydric soil status: Not hydric

448—Haploxerolls clay loam, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Irrigated crops, pasture, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 140 to 190 feet (43 to 59 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Haploxerolls clay loam—75 percent
Minor components—25 percent

Characteristics of Haploxerolls Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium derived from volcanic rocks
Observed vegetation: Almond, walnut, and prune orchards, sugar beets, alfalfa, beans, and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 40 to 80 inches
Available water capacity: Very high (about 11.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3s-3
Land capability, nonirrigated: 2s-3
Storie index: 76 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 5 inches; clay loam
Ap2—5 to 10 inches; clay loam
Bw1—10 to 24 inches; clay loam
Bw2—24 to 39 inches; clay loam
Bw3—39 to 66 inches; loam

Minor Components in Map Unit 448

Haploxerolls loam and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Busacca clay and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to a duripan or volcanic sediments
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to a gravelly substratum
Composition: 4 percent
Slope: 0 to 2 percent

Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to a duripan
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Clayey soils that are 40 to 60 inches deep to a duripan
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Basins on alluvial fans
Hydric soil status: Not hydric

449—Haploxerolls loam, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Irrigated crops, pasture, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 150 to 200 feet (46 to 61 meters)
Mean annual precipitation: 22 to 24 inches (559 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 255 days

Map Unit Composition

Haploxerolls loam—75 percent
Minor components—25 percent

Characteristics of Haploxerolls Loam

Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Parent material: Fine-loamy alluvium derived from volcanic rocks
Observed vegetation: Almond, walnut, and prune orchards, sugar beets, alfalfa, beans, and valley oak
Surface feature: Most areas have been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (dense material): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 40 to 80 inches
Available water capacity: High (about 9.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3s-3
Land capability, nonirrigated: 2s-3
Storie index: 84 (revised)

Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 4 inches; loam
Ap2—4 to 10 inches; loam
Bw1—10 to 24 inches; loam
Bw2—24 to 36 inches; loam
Bw3—36 to 52 inches; loam
C—52 to 60 inches; sandy loam

Minor Components in Map Unit 449

Soils that are 20 to 60 inches deep to a duripan or volcanic sediments
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to a duripan
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Soils that are more than 34 inches deep to an extremely gravelly substratum
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Redsluff gravelly loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Low fan terraces
Hydric soil status: Not hydric

Haploxerolls clay loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Busacca clay loam and similar soils
Composition: 4 percent
Slope: 0 to 2 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

500—Lofgren-Blavo complex, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 110 feet (18 to 34 meters)

Mean annual precipitation: 18 to 20 inches (457 to 508 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Lofgren clay—45 percent
Blavo clay—40 percent
Minor components—15 percent

Characteristics of Lofgren Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 60 inches
- *Available water capacity:* Moderate (about 6.7 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 17 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 5 inches; clay
- Bssg1—5 to 12 inches; clay
- Bssg2—12 to 29 inches; clay
- Bkssg—29 to 38 inches; clay
- Bkg—38 to 44 inches; clay
- 2Bkq—44 to 47 inches; clay loam
- 2Bkqm1—47 to 62 inches; duripan
- 2Bkqm2—62 to 82 inches; duripan

Characteristics of Blavo Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins

Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 36 inches
Available water capacity: Moderate (about 5.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 7 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 5 inches; clay
Bssg1—5 to 16 inches; clay
Bssg2—16 to 24 inches; clay
Bkssg—24 to 30 inches; clay
Bkg—30 to 36 inches; clay loam
2Bkqm—36 to 60 inches; duripan

Minor Components in Map Unit 500

Edjobe clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled terraces
Hydric soil status: Hydric

Soils that formed in fill
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Filled sloughs on flood basins
Hydric soil status: Hydric

501—Lofgren-Blavo complex, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 95 feet (18 to 30 meters)
Mean annual precipitation: 18 to 20 inches (457 to 508 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 240 to 245 days

Map Unit Composition

Lofgren clay, occasionally flooded—45 percent
Blavo clay, occasionally flooded—40 percent
Minor components—15 percent

Characteristics of Lofgren Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 60 inches
- *Available water capacity:* Moderate (about 6.4 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 17 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap1—0 to 5 inches; clay
- Ap2—5 to 12 inches; clay
- Bssg—12 to 22 inches; clay

Bkssg1—22 to 30 inches; clay
Bkssg2—30 to 41 inches; clay
Bk—41 to 45 inches; clay loam
2Bkqm—45 to 60 inches; duripan

Characteristics of Blavo Clay, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional

Typical profile
Ap1—0 to 6 inches; clay
Ap2—6 to 10 inches; clay
Bssg—10 to 22 inches; clay
Bkssg—22 to 29 inches; clay
Bkg—29 to 36 inches; clay loam
2Bkqm—36 to 42 inches; duripan

Minor Components in Map Unit 501

Clear Lake clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that formed in fill
Composition: 5 percent
Slope: 0 to 1 percent

Geomorphic position: Filled sloughs on flood basins
Hydric soil status: Hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled terraces
Hydric soil status: Hydric

502—Blavo silt loam, 0 to 1 percent slopes, overwash, occasionally flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 95 feet (24 to 29 meters)
Mean annual precipitation: 19 inches (483 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 240 days

Map Unit Composition

Blavo silt loam, overwash, occasionally flooded—80 percent
Minor components—20 percent

Characteristics of Blavo Silt Loam, Overwash, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Silty alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 36 inches
Available water capacity: Moderate (about 5.4 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2

Land capability, nonirrigated: 5w-2
Storie index: 14 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 7 inches; silt loam
Bssgb1—7 to 14 inches; clay
Bssgb2—14 to 22 inches; clay
Bssgb3—22 to 29 inches; clay
Bkgb—29 to 36 inches; clay
2Bkqmb—36 to 50 inches; duripan

Minor Components in Map Unit 502

Blavo clay, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Columbia taxadjunct very fine sandy loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

Lofgren clay, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Lofgren silt loam, overwash, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Columbia sand and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Channels
Hydric soil status: Hydric

519—Edjobe silty clay, 0 to 1 percent slopes

Map Unit Setting

General location: West-central Butte County
Major uses: Grain crops, row crops, and orchard crops
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 150 feet (35 to 46 meters)
Mean annual precipitation: 20 to 22 inches (508 to 559 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Edjobe silty clay—85 percent
Minor components—15 percent

Characteristics of Edjobe Silty Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, prune orchards, almond orchards, and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Silty clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 10 to 80 inches
- *Available water capacity:* Very high (about 10.0 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 29 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 8 inches; silty clay
- Bssg—8 to 25 inches; silty clay
- Bkssg—25 to 32 inches; silty clay
- Bw1—32 to 48 inches; silty clay loam
- 2Bw2—48 to 60 inches; clay loam
- 2Bq—60 to 69 inches; clay loam
- 2Bkqm—69 to 75 inches; duripan

Minor Components in Map Unit 519

Busacca and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Conejo clay loam and similar soils
Composition: 5 percent

Slope: 0 to 1 percent
Geomorphic position: Distal alluvial fans
Hydric soil status: Not hydric

Esquon silty clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

520—Esquon-Neerdobe complex, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 to 170 feet (17 to 52 meters)
Mean annual precipitation: 18 to 25 inches (457 to 635 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 240 to 250 days

Map Unit Composition

Esquon clay—60 percent
Neerdobe clay—30 percent
Minor components—10 percent

Characteristics of Esquon Clay

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Rare
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 60 inches
- *Available water capacity:* High (about 8.9 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2

Land capability, nonirrigated: 5w-2
Storie index: 24 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile

Hydric soil status: Hydric

Urban land
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins

Esquon loamy sand to silty clay, overwash, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

521—Neerdobe silt loam, 0 to 1 percent slopes, overwash

Map Unit Setting

General location: Central Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 100 to 150 feet (32 to 47 meters)
Mean annual precipitation: 21 to 24 inches (533 to 610 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Neerdobe silt loam, overwash—85 percent
Minor components—15 percent

Characteristics of Neerdobe Silt Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Flood-deposited, silty alluvium over clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice and annual grasses and forbs
Surface features: Overwash originating from the Cherokee Gold Mine consists of silt loam and loamy very fine sand that have buried the natural surface layer of clay. The surface has been leveled for agriculture.

Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 60 inches
Available water capacity: Moderate (about 7.4 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 24 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
Ap—0 to 7 inches; silt loam
C1—7 to 16 inches; silt loam
C2—16 to 20 inches; loamy very fine sand
Ab—20 to 33 inches; clay
Bssb—33 to 47 inches; clay
2Bkqmb—47 to 52 inches; cemented, very gravelly duripan
2Bkqb—52 to 60 inches; duripan

Minor Components in Map Unit 521

Oxyaquic Xerofluvents, loamy overwash, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Neerdobe clay and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

522—Clear Lake silty clay loam, 0 to 1 percent slopes, overwash, frequently flooded

Map Unit Setting

General location: Southwestern Butte County
Major uses: Hunting and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 feet (17 meters)
Mean annual precipitation: 18 inches (457 millimeters)
Mean annual air temperature: 59 degrees F (15 degrees C)
Frost-free period: 240 days

Map Unit Composition

Clear Lake silty clay loam, overwash—80 percent
Minor components—15 percent

Characteristics of Clear Lake Silty Clay Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Flood-deposited, silty alluvium over silty and clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Tules, swamp timothy, smartweed, sourdock, spike rush, bulrush, arnica ssp., willows, cottonwood, bermudagrass, and cattails
Surface feature: The surface layer of silty clay loam is flood-deposited overwash 5 to 20 inches thick.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 80 inches
- *Available water capacity:* High (about 9.7 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 31 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
A—0 to 6 inches; silty clay loam
Akb—6 to 12 inches; silty clay
Bkssb1—12 to 35 inches; silty clay
Bkssb2—35 to 50 inches; silty clay
Bkgb1—50 to 60 inches; silty clay
Bkgb2—60 to 70 inches; silty clay
Bkgb3—70 to 72 inches; silty clay

Minor Components in Map Unit 522

Oxyaquic Xerofluvents silty clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon silty clay loam, overwash, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Wet soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Intermittent ponds, channels, and sloughs on flood basins
Hydric soil status: Hydric

Soils that are more than 60 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Saturated soils that are not subject to cracking
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

523—Esquon silty clay loam, 0 to 1 percent slopes, overwash, frequently flooded

Map Unit Setting

General location: Southwestern Butte County and northwestern Sutter County
Major uses: Hunting and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 55 feet (17 meters)
Mean annual precipitation: 18 inches (457 millimeters)
Mean annual air temperature: 59 degrees F (15 degrees C)
Frost-free period: 240 days

Map Unit Composition

Esquon silty clay loam, overwash—80 percent
Minor components—20 percent

Characteristics of Esquon Silty Clay Loam, Overwash

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Flood-deposited, silty alluvium over silty and clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Cocklebur, spikerush, curly dock, bulrush, willows, bermudagrass, cottonwood, and tules
Surface features: Flood-deposited overwash is 6 to 12 inches thick. In some areas alteration of the surface has improved the habitat for wetland wildlife.
Texture of the surface layer: Silty clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 60 inches
- *Available water capacity:* High (about 7.7 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 5w-2
- *Land capability, nonirrigated:* 5w-2
- *Storie index:* 47 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 10 inches; silty clay loam
- Ab—10 to 18 inches; silty clay
- Bkssb—18 to 46 inches; silty clay
- Bkqmb—46 to 60 inches; duripan

Minor Components in Map Unit 523

Wet soils
Composition: 6 percent
Slope: 0 percent
Geomorphic position: Intermittent ponds, channels, and sloughs on flood basins
Hydric soil status: Hydric

Neerdobe silty clay loam or clay loam, overwash, and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Oxyaquic Xerofluvents and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Esquon silt loam, overwash, and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Soils that are more than 60 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Saturated soils that are not subject to cracking
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

525—Govstanford loam, 0 to 1 percent slopes

Map Unit Setting

General location: West-central Butte County
Major uses: Homesite development, orchard crops, and pasture
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 120 to 160 feet (38 to 49 meters)
Mean annual precipitation: 22 to 23 inches (559 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Govstanford loam—85 percent
Minor components—15 percent

Characteristics of Govstanford Loam

Slope: 0 to 1 percent
Geomorphic position: Alluvial fans above flood basins
Parent material: Coarse-loamy alluvium generated from hydraulic mines and derived from igneous and metamorphic rocks over clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond, walnut, and prune orchards, pasture, and valley oak
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Loam

Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 20 to 36 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: The hydrology has been changed by the construction of levees.
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 20 to 72 inches
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3s-3
Land capability, nonirrigated: 3s-3
Storie index: 52 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Ap1—0 to 3 inches; loam
Ap2—3 to 11 inches; loam
C1—11 to 18 inches; sandy loam
C2—18 to 25 inches; silt loam
C3—25 to 34 inches; silt loam
2Assg—34 to 42 inches; clay
2Bssg1—42 to 61 inches; silty clay
2Bssg2—61 to 72 inches; silty clay

Minor Components in Map Unit 525

Soils that have overwash less than 20 inches thick
Composition: 8 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans above flood basins
Hydric soil status: Not hydric

Typic Xerofluvents, coarse-loamy, and similar soils
Composition: 4 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans above flood basins
Hydric soil status: Not hydric

Edjobe silty clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Gravelly soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

526—Govstanford loam, 0 to 1 percent slopes, occasionally flooded

Map Unit Setting

General location: West-central Butte County
Major uses: Orchard crops, row crops, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 140 feet (34 to 44 meters)
Mean annual precipitation: 20 to 23 inches (508 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 245 to 250 days

Map Unit Composition

Govstanford loam, occasionally flooded—85 percent
Minor components—15 percent

Characteristics of Govstanford Loam, Occasionally Flooded

Slope: 0 to 1 percent
Geomorphic position: Flood plains above flood basins
Parent material: Coarse-loamy alluvium generated from hydraulic mines and derived from igneous and metamorphic rocks over clayey alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Almond, walnut, and prune orchards and riparian forest
Surface feature: The surface has been leveled for agriculture.
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (abrupt textural change): 20 to 36 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* The hydrology has been changed by the construction of levees.
- *Annual flooding frequency:* Occasional
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 20 to 72 inches
- *Available water capacity:* Moderate (about 5.5 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very low

Interpretive groups
- *Land capability, irrigated:* 3w-2
- *Land capability, nonirrigated:* 3w-2
- *Storie index:* 52 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- Ap1—0 to 3 inches; loam
- Ap2—3 to 11 inches; loam
- C1—11 to 18 inches; sandy loam
- C2—18 to 25 inches; silt loam
- C3—25 to 34 inches; silt loam
- 2Assg—34 to 42 inches; clay
- 2Bssg1—42 to 61 inches; silty clay
- 2Bssg2—61 to 72 inches; silty clay

Minor Components in Map Unit 526

Xerofluvents sandy loam, frequently flooded, and similar soils
Composition: 10 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains above flood basins
Hydric soil status: Not hydric

Oxyaquic Xerofluvents sandy loam, frequently flooded, and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains above flood basins
Hydric soil status: Hydric

Edjobe silty clay and similar soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

Gravelly soils
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Flood plains above flood basins
Hydric soil status: Not hydric

528—Neerdobe clay loam, 0 to 1 percent slopes

Map Unit Setting

General location: Southwestern Butte County
Major uses: Cropland
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 85 to 90 feet (26 to 28 meters)
Mean annual precipitation: 20 inches (508 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 245 days

Map Unit Composition

Neerdobe clay loam—90 percent
Minor components—10 percent

Characteristics of Neerdobe Clay Loam

Slope: 0 to 1 percent
Geomorphic position: Flood basins
Parent material: Clayey alluvium over cemented, loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Rice, annual grasses and forbs, and scattered valley oak
Surface features: The surface has been leveled for agriculture. Polygonal cracks open during dry periods.
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Flood-control structures have reduced the frequency and duration of flooding. Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, levees, leveling, and urban construction have modified overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: Rare
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 13 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 10 inches; clay loam
Bss1—10 to 18 inches; clay
Bss2—18 to 25 inches; clay
2Bqm—25 inches; duripan

Minor Components in Map Unit 528

Gridley clay loam and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Margins of terraces and flood basins
Hydric soil status: Not hydric

Soils that are frequently flooded
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Irrigation ditches and channels on flood basins
Hydric soil status: Hydric

Soils that are 10 to 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Flood basins
Hydric soil status: Hydric

550—Dunstone-Loafercreek complex, dry, 1 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 245 to 1,200 feet (76 to 366 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)

Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Dunstone loam, dry—60 percent
Loafercreek silt loam, dry—20 percent
Minor components—20 percent

Characteristics of Dunstone Loam, Dry

Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
BAt—2 to 7 inches; loam
Bt1—7 to 10 inches; loam
Bt2—10 to 16 inches; loam
Cr—16 inches; bedrock

Characteristics of Loafercreek Silt Loam, Dry

Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 2 inches; silt loam
A2—2 to 4 inches; silt loam
BAt—4 to 11 inches; loam
Bt1—11 to 20 inches; loam
Bt2—20 to 29 inches; loam
Crt—29 inches; bedrock

Minor Components in Map Unit 550

Auburn loam and similar soils
Composition: 9 percent
Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 5 percent
Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Lomarica and similar soils
Composition: 2 percent
Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Clayey soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 1 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

551—Dunstone-Lomarica-Argonaut taxadjunct complex, 15 to 30 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18

Landscape: Northern Sierra Nevada foothills
Elevation: 200 to 1,600 feet (61 to 488 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Dunstone loam, dry—35 percent
Lomarica loam—15 percent
Argonaut taxadjunct loam—15 percent
Minor components—35 percent

Characteristics of Dunstone Loam, Dry

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 2.8 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 2 inches; loam
- BAt—2 to 7 inches; loam
- Bt1—7 to 10 inches; loam
- Bt2—10 to 16 inches; loam
- Cr—16 inches; bedrock

Characteristics of Lomarica Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 2 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-4
Land capability, nonirrigated: 4e-4
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 1 inch; loam
BAt—1 to 5 inches; loam
Bt1—5 to 9 inches; clay loam
Bt2—9 to 12 inches; clay loam
2Bt3—12 to 25 inches; extremely gravelly clay loam
2Btss—25 to 32 inches; extremely gravelly clay
2Cr—32 inches; bedrock

Characteristics of Argonaut Taxadjunct Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-4
Land capability, nonirrigated: 4e-4
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; clay loam
Bt2—8 to 14 inches; clay
Bt3—14 to 20 inches; clay
BCt1—20 to 26 inches; clay
BCt2—26 to 30 inches; clay loam
Cr—30 inches; bedrock

Minor Components in Map Unit 551

Loafercreek and similar soils
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Katskillhill and similar soils
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Auburn loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Clayey-skeletal soils that are more than 40 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Clayey-skeletal soils that are less than 20 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

552—Dunstone-Loafercreek complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, homesite development, watershed, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 245 to 1,200 feet (76 to 366 meters)
Mean annual precipitation: 29 to 40 inches (737 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Dunstone gravelly loam—45 percent
Loafercreek gravelly loam—40 percent
Minor components—15 percent

Characteristics of Dunstone Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Characteristics of Loafercreek Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 40 to 60 inches to lithic bedrock
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; gravelly loam
BAt—2 to 6 inches; gravelly loam
Bt1—6 to 12 inches; loam
Bt2—12 to 23 inches; gravelly loam
Bt3—23 to 31 inches; gravelly silt loam
Crt—31 to 42 inches; bedrock
R—42 inches; bedrock

Minor Components in Map Unit 552

Rock outcrop
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are less than 20 inches deep to lithic bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Soils in areas where the surface has been altered by leveling
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

553—Dunstone-Loafercreek complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, homesite development, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 245 to 1,200 feet (76 to 366 meters)
Mean annual precipitation: 29 to 40 inches (737 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Dunstone gravelly loam—45 percent
Loafercreek gravelly loam—40 percent
Minor components—15 percent

Characteristics of Dunstone Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Loamy colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1

Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Characteristics of Loafercreek Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 40 to 60 inches to lithic bedrock
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; gravelly loam
BAt—2 to 6 inches; gravelly loam
Bt1—6 to 12 inches; loam
Bt2—12 to 23 inches; gravelly loam
Bt3—23 to 31 inches; gravelly silt loam
Crt—31 to 42 inches; bedrock
R—42 inches; bedrock

Minor Components in Map Unit 553

Rock outcrop
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to lithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to lithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Soils in areas where the surface has been altered by leveling
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

554—Dunstone-Loafercreek complex, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 400 to 1,200 feet (122 to 366 meters)
Mean annual precipitation: 29 to 40 inches (737 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Dunstone gravelly loam—45 percent
Loafercreek gravelly loam—40 percent
Minor components—15 percent

Characteristics of Dunstone Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Characteristics of Loafercreek Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 40 to 60 inches to lithic bedrock
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; gravelly loam
BAt—2 to 6 inches; gravelly loam
Bt1—6 to 12 inches; loam
Bt2—12 to 23 inches; gravelly loam
Bt3—23 to 31 inches; gravelly silt loam

Crt—31 to 42 inches; bedrock
R—42 inches; bedrock

Minor Components in Map Unit 554

Rock outcrop
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to lithic bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

555—Dunstone-Loafercreek complex, 50 to 90 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and recreation
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 400 to 1,200 feet (122 to 366 meters)
Mean annual precipitation: 29 to 40 inches (737 to 1,016 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Dunstone gravelly loam—45 percent
Loafercreek gravelly loam—40 percent
Minor components—15 percent

Characteristics of Dunstone Gravelly Loam

Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills

Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Characteristics of Loafercreek Gravelly Loam

Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature: 20 to 40 inches to paralithic bedrock; 40 to 60 inches to lithic bedrock
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8

Bt2—12 to 23 inches; gravelly loam
Bt3—23 to 31 inches; gravelly silt loam
Crt—31 to 42 inches; bedrock
R—42 inches; bedrock

Minor Components in Map Unit 555

Rock outcrop
Composition: 9 percent
Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are less than 10 inches deep to lithic bedrock
Composition: 3 percent
Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Soils in areas where the surface has been altered by cutting
Composition: 1 percent
Slope: 50 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

556—Mounthope-Hartsmill complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 45 inches (1,016 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Mounthope loam—50 percent
Hartsmill gravelly loam—40 percent
Minor components—10 percent

Characteristics of Mounthope Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Blue oak, foothill pine, interior live oak, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Hartsmill Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-7
Land capability, nonirrigated: 3e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 6 inches; very gravelly loam
Bt2—6 to 13 inches; very gravelly loam
Bt3—13 to 24 inches; very gravelly loam
BCt1—24 to 35 inches; very cobbly clay loam
BCt2—35 to 62 inches; extremely cobbly clay loam
Crt—62 inches; bedrock

Minor Components in Map Unit 556

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Soils in areas where the surface has been altered by clearing
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Dunstone gravelly loam and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

557—Mounthope-Hartsmill complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 45 inches (1,016 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Mounthope loam—50 percent
Hartsmill gravelly loam—40 percent
Minor components—10 percent

Characteristics of Mounthope Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Blue oak, foothill pine, interior live oak, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.7 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A—1 to 3 inches; loam
- Bt1—3 to 7 inches; loam
- Bt2—7 to 15 inches; loam
- Bt3—15 to 22 inches; gravelly clay loam
- Bt4—22 to 26 inches; gravelly clay loam
- Bt5—26 to 31 inches; very gravelly clay loam

Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Hartsmill Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Parent material: Loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 6 inches; very gravelly loam
Bt2—6 to 13 inches; very gravelly loam
Bt3—13 to 24 inches; very gravelly loam
BCt1—24 to 35 inches; very cobbly clay loam
BCt2—35 to 62 inches; extremely cobbly clay loam
Crt—62 inches; bedrock

Minor Components in Map Unit 557

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 15 to 30 percent

Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Dunstone gravelly loam and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic hills
Hydric soil status: Not hydric

558—Hartsmill-Mounthope complex, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 45 inches (1,016 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Hartsmill gravelly loam—55 percent
Mounthope loam—30 percent
Minor components—15 percent

Characteristics of Hartsmill Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 6 inches; very gravelly loam
Bt2—6 to 13 inches; very gravelly loam
Bt3—13 to 24 inches; very gravelly loam
BCt1—24 to 35 inches; very cobbly clay loam
BCt2—35 to 62 inches; extremely cobbly clay loam
Crt—62 inches; bedrock

Characteristics of Mounthope Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Shrubs, live oak, and foothill pine
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Minor Components in Map Unit 558

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 7 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to paralithic bedrock
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Dunstone gravelly loam and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

559—Hartsmill-Mounthope complex, 50 to 70 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 45 inches (1,016 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Hartsmill gravelly loam—55 percent
Mounthope loam—30 percent
Minor components—15 percent

Characteristics of Hartsmill Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders

Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 6 inches; very gravelly loam
Bt2—6 to 13 inches; very gravelly loam
Bt3—13 to 24 inches; very gravelly loam
BCt1—24 to 35 inches; very cobbly clay loam
BCt2—35 to 62 inches; extremely cobbly clay loam
Crt—62 inches; bedrock

Characteristics of Mounthope Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Blue oak, foothill pine, interior live oak, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam

Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Minor Components in Map Unit 559

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Dunstone gravelly loam and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

560—Hartsmill-Mounthope complex, 70 to 90 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 40 to 45 inches (1,016 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Hartsmill gravelly loam—50 percent
Mounthope loam—30 percent
Minor components—20 percent

Characteristics of Hartsmill Gravelly Loam

Slope: 70 to 90 percent

Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 6 inches; very gravelly loam
Bt2—6 to 13 inches; very gravelly loam
Bt3—13 to 24 inches; very gravelly loam
BCt1—24 to 35 inches; very cobbly clay loam
BCt2—35 to 62 inches; extremely cobbly clay loam
Crt—62 inches; bedrock

Characteristics of Mounthope Loam

Slope: 70 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Blue oak, foothill pine, interior live oak, manzanita, buckbrush, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Minor Components in Map Unit 560

Rock outcrop
Composition: 7 percent
Slope: 70 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 10 to 20 inches deep to bedrock
Composition: 6 percent
Slope: 70 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Dunstone gravelly loam and similar soils
Composition: 4 percent
Slope: 70 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 70 to 90 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

561—Bigridge-Minniecreek complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, homesite development, watershed, and limited timber production
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 2,000 to 2,595 feet (610 to 792 meters)
Mean annual precipitation: 45 to 50 inches (1,143 to 1,270 millimeters)

Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Bigridge loam—50 percent
Minniecreek loam—35 percent
Minor components—15 percent

Characteristics of Bigridge Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-7
Land capability, nonirrigated: 3e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Minniecreek Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 40 percent coarse, angular gravel, 0 to 25 percent angular cobbles, 0 to 15 percent angular stones, 0 to 10 percent angular boulders

Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-7
Land capability, nonirrigated: 3e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BAt—2 to 8 inches; loam
Bt1—8 to 15 inches; loam
Bt2—15 to 24 inches; silty clay loam
BCt—24 to 32 inches; silty clay loam
Crt1—32 to 47 inches; bedrock
Crt2—47 to 58 inches; bedrock
Cr—58 to 75 inches; bedrock

Minor Components in Map Unit 561

Rock outcrop
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Ridgetops on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Hydric soil status: Not hydric

Hartsmill and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic hills
Hydric soil status: Not hydric

562—Bigridge-Minniecreek complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, homesite development, watershed, and limited timber production
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 2,000 to 2,595 feet (610 to 792 meters)
Mean annual precipitation: 45 to 50 inches (1,143 to 1,270 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Bigridge loam—50 percent
Minniecreek loam—35 percent
Minor components—15 percent

Characteristics of Bigridge Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam

Minor Components in Map Unit 562

Rock outcrop
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Hartsmill and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic hills
Hydric soil status: Not hydric

563—Bigridge-Minniecreek complex, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,800 to 2,595 feet (549 to 792 meters)
Mean annual precipitation: 45 to 50 inches (1,143 to 1,270 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Bigridge loam—50 percent
Minniecreek loam—35 percent
Minor components—15 percent

Characteristics of Bigridge Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Minniecreek Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 40 percent coarse, angular gravel, 0 to 25 percent angular cobbles, 0 to 15 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Crt1—32 to 47 inches; bedrock
Crt2—47 to 58 inches; bedrock
Cr—58 to 75 inches; bedrock

Minor Components in Map Unit 563

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent

Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Hartsmill and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Surnuf taxadjunct and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Concave backslopes on metavolcanic hills

Loamy soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

564—Bigridge-Minniecreek complex, 50 to 70 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 2,000 to 2,595 feet (610 to 792 meters)
Mean annual precipitation: 45 to 50 inches (1,143 to 1,270 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Bigridge loam—50 percent
Minniecreek loam—35 percent
Minor components—15 percent

Characteristics of Bigridge Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks

Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Minniecreek Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Parent material: Loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, California black oak, interior live oak, whiteleaf manzanita, Pacific poison oak, and toyon
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 40 percent coarse, angular gravel, 0 to 25 percent angular cobbles, 0 to 15 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BAt—2 to 8 inches; loam
Bt1—8 to 15 inches; loam
Bt2—15 to 24 inches; silty clay loam
BCt—24 to 32 inches; silty clay loam
Crt1—32 to 47 inches; bedrock
Crt2—47 to 58 inches; bedrock
Cr—58 to 75 inches; bedrock

Minor Components in Map Unit 564

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic hills
Hydric soil status: Not hydric

565—Dunstone-Argonaut taxadjunct-Sunnyslope complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 200 to 1,600 feet (61 to 488 meters)
Mean annual precipitation: 28 to 35 inches (711 to 889 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Dunstone loam, dry—35 percent
Argonaut taxadjunct loam—30 percent

Sunnyslope loam—20 percent
Minor components—15 percent

Characteristics of Dunstone Loam, Dry

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
BAt—2 to 7 inches; loam
Bt1—7 to 10 inches; loam
Bt2—10 to 16 inches; loam
Cr—16 inches; bedrock

Characteristics of Argonaut Taxadjunct Loam

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Clayey residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-4
Land capability, nonirrigated: 3e-4

Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; clay loam
Bt2—8 to 14 inches; clay
Bt3—14 to 20 inches; clay
BCt1—20 to 26 inches; clay
BCt2—26 to 30 inches; clay loam
Cr—30 inches; bedrock

Characteristics of Sunnyslope Loam

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 6 inches; gravelly loam
Bt2—6 to 10 inches; very cobbly loam
Bt3—10 to 14 inches; extremely gravelly clay loam
Crt—14 inches; bedrock

Minor Components in Map Unit 565

Fine textured soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Loafercreek and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Auburn loam and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Soils that have an abrupt clay layer and are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

566—Dunstone-Loafercreek-Katskillhill complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 295 to 895 feet (91 to 274 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Dunstone loam, dry—45 percent
Loafercreek silt loam, dry—20 percent
Katskillhill loam—15 percent
Minor components—20 percent

Characteristics of Dunstone Loam, Dry

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.8 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
BAt—2 to 7 inches; loam
Bt1—7 to 10 inches; loam
Bt2—10 to 16 inches; loam
Cr—16 inches; bedrock

Characteristics of Loafercreek Silt Loam, Dry

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 2 inches; silt loam
A2—2 to 4 inches; silt loam
BAt—4 to 11 inches; loam
Bt1—11 to 20 inches; loam
Bt2—20 to 29 inches; loam
Crt—29 inches; bedrock

Characteristics of Katskillhill Loam

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum over clayey residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam

Percentage of the surface covered by rock fragments: 0 to 3 percent medium, subangular gravel
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
BAt—2 to 8 inches; loam
Bt1—8 to 12 inches; very gravelly loam
2Bt2—12 to 19 inches; clay
2Btss1—19 to 29 inches; clay
2Btss2—29 to 42 inches; clay
2R—42 inches; bedrock

Minor Components in Map Unit 566

Auburn loam and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Clayey soils that are 10 to 20 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Lomarica and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Argonaut taxadjunct loam and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Clayey-skeletal soils that are more than 40 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

567—Dunstone-Loafercreek-Argonaut taxadjunct complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 200 to 1,600 feet (61 to 488 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 57 to 63 degrees F (14 to 17 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Dunstone loam, dry—40 percent
Loafercreek silt loam, dry—25 percent
Argonaut taxadjunct loam—20 percent
Minor components—15 percent

Characteristics of Dunstone Loam, Dry

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
BAt—2 to 7 inches; loam
Bt1—7 to 10 inches; loam
Bt2—10 to 16 inches; loam
Cr—16 inches; bedrock

Characteristics of Loafercreek Silt Loam, Dry

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Loamy residuum weathered from metavolcanic rocks

Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Silt loam
Percentage of the surface covered by rock fragments: 0 to 25 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 2 inches; silt loam
A2—2 to 4 inches; silt loam
BAt—4 to 11 inches; loam
Bt1—11 to 20 inches; loam
Bt2—20 to 29 inches; loam
Crt—29 inches; bedrock

Characteristics of Argonaut Taxadjunct Loam

Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Parent material: Clayey residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-4
Land capability, nonirrigated: 3e-4
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; clay loam

Bt2—8 to 14 inches; clay
Bt3—14 to 20 inches; clay
BCt1—20 to 26 inches; clay
BCt2—26 to 30 inches; clay loam
Cr—30 inches; bedrock

Minor Components in Map Unit 567

Auburn loam and similar soils
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Katskillhill and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Soils that have an abrupt clay layer and are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Metavolcanic hills
Hydric soil status: Not hydric

577—Parkshill-Flanly-Hurleton complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, wildlife habitat, homesite development, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 495 to 2,200 feet (152 to 671 meters)
Mean annual precipitation: 32 to 45 inches (813 to 1,143 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 260 days

Map Unit Composition

Parkshill coarse sandy loam—40 percent
Flanly loam—25 percent
Hurleton gravelly sandy loam—20 percent
Minor components—15 percent

Characteristics of Parkshill Coarse Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Parent material: Fine-loamy residuum weathered from intrusive igneous rocks

Observed vegetation: Annual grasses and forbs, blue oak, and scattered interior live oak, foothill pine, whiteleaf manzanita, buckbrush, Pacific poison oak, valley oak, and ponderosa pine
Texture of the surface layer: Coarse sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-4
Land capability, nonirrigated: 4e-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; coarse sandy loam
AB—2 to 8 inches; coarse sandy loam
Bw1—8 to 18 inches; coarse sandy loam
Bw2—18 to 26 inches; coarse sandy loam
Bt1—26 to 35 inches; sandy clay loam
Bt2—35 to 53 inches; sandy clay loam
BCt—53 to 61 inches; sandy clay loam

Characteristics of Flanly Loam

Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Parent material: Fine-loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 3 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BA—2 to 5 inches; sandy loam
Bt1—5 to 10 inches; sandy loam
Bt2—10 to 23 inches; sandy clay loam
Crt—23 to 26 inches; bedrock

Characteristics of Hurleton Gravelly Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Parent material: Gravelly and loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Gravelly sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 3 inches; gravelly sandy loam
A2—3 to 7 inches; gravelly sandy loam
BA—7 to 12 inches; gravelly sandy loam
Bt1—12 to 16 inches; very gravelly sandy loam
Bt2—16 to 19 inches; very gravelly sandy loam
Bt3—19 to 25 inches; extremely gravelly sandy clay loam
R—25 inches; bedrock

Minor Components in Map Unit 577

Mounthope and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Swedesflat and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Coarse-loamy soils that are less than 40 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 2 to 15 percent

Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Argonaut taxadjunct loam and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

578—Flanly-Swedesflat complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 495 to 1,945 feet (152 to 594 meters)
Mean annual precipitation: 32 to 45 inches (813 to 1,143 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 260 days

Map Unit Composition

Flanly loam—45 percent
Swedesflat cobbly fine sandy loam—35 percent
Minor components—20 percent

Characteristics of Flanly Loam

Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Parent material: Fine-loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 3 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1

Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BA—2 to 5 inches; sandy loam
Bt1—5 to 10 inches; sandy loam
Bt2—10 to 23 inches; sandy clay loam
Crt—23 to 26 inches; bedrock

Characteristics of Swedesflat Cobbly Fine Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Parent material: Cobbly and loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Cobbly fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 3 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; cobbly fine sandy loam
ABt—2 to 8 inches; cobbly sandy loam
Bt—8 to 12 inches; sandy loam
Crt—12 to 18 inches; bedrock
Cr—18 inches; bedrock

Minor Components in Map Unit 578

Fine-loamy soils that are 40 to 60 inches deep to lithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Argonaut taxadjunct loam and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Loamy soils that are less than 20 inches deep to lithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Granitic hills
Hydric soil status: Not hydric

580—Surnuf taxadjunct-Griffgulch-Rock outcrop complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 2,995 feet (610 to 914 meters)
Mean annual precipitation: 50 to 55 inches (1,270 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Surnuf taxadjunct loam—40 percent
Griffgulch very gravelly silt loam—25 percent
Rock outcrop (metavolcanic)—20 percent
Minor components—15 percent

Characteristics of Surnuf Taxadjunct Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular boulders, 0 to 15 percent subangular stones, 0 to 20 percent subangular cobbles, 0 to 30 percent subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; loam
Bt1—5 to 11 inches; clay loam
Bt2—11 to 18 inches; silty clay
Bt3—18 to 31 inches; silty clay
Bt4—31 to 43 inches; silty clay
Bt5—43 to 54 inches; very stony silty clay loam
BCt—54 to 67 inches; silty clay loam

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Silty and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Characteristics of Rock Outcrop (Metavolcanic)

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 580

Areas with piles of boulders and stones on the surface
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to lithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 35 percent clay in the upper part of the subsoil
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are more than 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

581—Surnuf taxadjunct-Griffgulch complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 2,995 feet (274 to 914 meters)
Mean annual precipitation: 50 to 55 inches (1,270 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Surnuf taxadjunct loam—65 percent
Griffgulch very gravelly silt loam—20 percent
Minor components—15 percent

Characteristics of Surnuf Taxadjunct Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains

Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular boulders, 0 to 15 percent subangular stones, 0 to 20 percent subangular cobbles, 0 to 30 percent subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; loam
Bt1—5 to 11 inches; clay loam
Bt2—11 to 18 inches; silty clay
Bt3—18 to 31 inches; silty clay
Bt4—31 to 43 inches; silty clay
Bt5—43 to 54 inches; very stony silty clay loam
BCt—54 to 67 inches; silty clay loam

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Minor Components in Map Unit 581

Areas with piles of boulders and stones on the surface
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to lithic bedrock
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 35 percent clay in the upper part of the subsoil
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are more than 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

582—Surnuf taxadjunct-Griffgulch complex, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 2,995 feet (274 to 914 meters)
Mean annual precipitation: 50 to 55 inches (1,270 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Surnuf taxadjunct loam—50 percent
Griffgulch very gravelly silt loam—35 percent
Minor components—15 percent

Characteristics of Surnuf Taxadjunct Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders, 0 to 20 percent subangular cobbles, 0 to 30 percent subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; loam
Bt1—5 to 11 inches; clay loam
Bt2—11 to 18 inches; silty clay
Bt3—18 to 31 inches; silty clay
Bt4—31 to 43 inches; silty clay
Bt5—43 to 54 inches; very stony silty clay loam
BCt—54 to 67 inches; silty clay loam

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium,

subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Minor Components in Map Unit 582

Areas with piles of boulders and stones on the surface
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to lithic bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 35 percent clay in the upper part of the subsoil
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are more than 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

583—Surnuf taxadjunct-Griffgulch complex, 50 to 70 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 2,995 feet (274 to 914 meters)
Mean annual precipitation: 50 to 55 inches (1,270 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Surnuf taxadjunct loam—50 percent
Griffgulch very gravelly silt loam—35 percent
Minor components—15 percent

Characteristics of Surnuf Taxadjunct Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular boulders, 10 to 15 percent subangular stones, 0 to 20 percent subangular cobbles, 0 to 30 percent subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; loam
Bt1—5 to 11 inches; clay loam
Bt2—11 to 18 inches; silty clay
Bt3—18 to 31 inches; silty clay
Bt4—31 to 43 inches; silty clay
Bt5—43 to 54 inches; very stony silty clay loam
BCt—54 to 67 inches; silty clay loam

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, deerbrush, whiteleaf manzanita, Pacific poison oak, and Pacific madrone
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Minor Components in Map Unit 583

Areas with piles of boulders and stones on the surface
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to lithic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 35 percent clay in the upper part of the subsoil
Composition: 3 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are more than 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

584—Flanly-Swedesflat-Rackerby complex, 15 to 30 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, wildlife habitat, homesite development, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 495 to 2,095 feet (152 to 640 meters)
Mean annual precipitation: 30 to 50 inches (762 to 1,270 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 260 days

Map Unit Composition

Flanly loam—35 percent
Swedesflat cobbly fine sandy loam—30 percent
Rackerby very gravelly sandy loam—25 percent
Minor components—10 percent

Characteristics of Flanly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Fine-loamy residuum and/or colluvium derived from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 3 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BA—2 to 5 inches; sandy loam
Bt1—5 to 10 inches; sandy loam
Bt2—10 to 23 inches; sandy clay loam
Crt—23 to 26 inches; bedrock

Characteristics of Swedesflat Cobbly Fine Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Cobbly and loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Cobbly fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 3 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; cobbly fine sandy loam
ABt—2 to 8 inches; cobbly sandy loam
Bt—8 to 12 inches; sandy loam
Crt—12 to 18 inches; bedrock
Cr—18 inches; bedrock

Characteristics of Rackerby Very Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Parent material: Gravelly and loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Very gravelly sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly sandy loam
AB—2 to 5 inches; gravelly sandy loam
Bw—5 to 13 inches; very gravelly sandy loam
Cr—13 inches; bedrock

Minor Components in Map Unit 584

Sommeyflat and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Hurleton and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

Loamy soils that are less than 20 inches deep to lithic bedrock
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic hills
Hydric soil status: Not hydric

585—Flanly-Sommeyflat complex, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, wildlife habitat, homesite development, and watershed

Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,095 to 2,200 feet (335 to 671 meters)
Mean annual precipitation: 35 to 50 inches (889 to 1,270 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Flanly loam—45 percent
Sommeyflat loam—35 percent
Minor components—20 percent

Characteristics of Flanly Loam

Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Parent material: Fine-loamy residuum weathered from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 3 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.4 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 2 inches; loam
- BA—2 to 5 inches; sandy loam
- Bt1—5 to 10 inches; sandy loam
- Bt2—10 to 23 inches; sandy clay loam
- Crt—23 to 26 inches; bedrock

Characteristics of Sommeyflat Loam

Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Parent material: Fine-loamy residuum and/or colluvium derived from intrusive igneous rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, Pacific poison oak, buckbrush, and whiteleaf manzanita
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 2 percent coarse, subangular gravel

Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BA—2 to 9 inches; loam
Bt1—9 to 14 inches; loam
Bt2—14 to 24 inches; loam
BCt—24 to 31 inches; loam
C1—31 to 62 inches; loam
C2—62 to 70 inches; loam

Minor Components in Map Unit 585

Mounthope and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

Loamy soils that are less than 20 inches deep to lithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

Argonaut taxadjunct loam and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

Hurleton and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

Fine textured soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Intrusive igneous hills
Hydric soil status: Not hydric

586—Sommeyflat-Mounthope complex, 15 to 30 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Wildlife habitat, homesite development, livestock grazing, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 1,600 to 2,095 feet (488 to 640 meters)
Mean annual precipitation: 45 to 55 inches (1,143 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Sommeyflat loam—45 percent
Mounthope loam—40 percent
Minor components—15 percent

Characteristics of Sommeyflat Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Parent material: Fine-loamy colluvium and/or residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, foothill pine, whiteleaf manzanita, Pacific poison oak, buckbrush, toyon, and ponderosa pine
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 2 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam

BA—2 to 9 inches; loam
Bt1—9 to 14 inches; loam
Bt2—14 to 24 inches; loam
BCt—24 to 31 inches; loam
C1—31 to 62 inches; loam
C2—62 to 70 inches; loam

Characteristics of Mounthope Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Parent material: Fine-loamy colluvium and/or residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, foothill pine, whiteleaf manzanita, Pacific poison oak, buckbrush, toyon, and ponderosa pine
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Minor Components in Map Unit 586

Flanly and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Hydric soil status: Not hydric

Argonaut taxadjunct loam and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Hydric soil status: Not hydric

Loamy soils that are less than 20 inches deep to lithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metamorphic and intrusive igneous hills
Hydric soil status: Not hydric

587—Sommeyflat-Mounthope-Hurleton complex, 30 to 50 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 800 to 1,800 feet (244 to 549 meters)
Mean annual precipitation: 35 to 45 inches (889 to 1,143 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Sommeyflat loam—35 percent
Mounthope loam—30 percent
Hurleton gravelly sandy loam—25 percent
Minor components—10 percent

Characteristics of Sommeyflat Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Parent material: Fine-loamy colluvium and/or residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, foothill pine, whiteleaf manzanita, Pacific poison oak, buckbrush, toyon, and ponderosa pine
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 2 percent coarse, subangular gravel

Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; loam
BA—2 to 9 inches; loam
Bt1—9 to 14 inches; loam
Bt2—14 to 24 inches; loam
BCt—24 to 31 inches; loam
C1—31 to 62 inches; loam
C2—62 to 70 inches; loam

Characteristics of Mounthope Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Parent material: Fine-loamy colluvium and/or residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, foothill pine, whiteleaf manzanita, Pacific poison oak, buckbrush, toyon, and ponderosa pine
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material

A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Hurleton Gravelly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Parent material: Gravelly and loamy colluvium and/or residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, foothill pine, whiteleaf manzanita, Pacific poison oak, buckbrush, toyon, and ponderosa pine
Texture of the surface layer: Gravelly sandy loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-4
Land capability, nonirrigated: 7e-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A1—0 to 3 inches; gravelly sandy loam
A2—3 to 7 inches; gravelly sandy loam
BA—7 to 12 inches; gravelly sandy loam
Bt1—12 to 16 inches; very gravelly sandy loam
Bt2—16 to 19 inches; very gravelly sandy loam
Bt3—19 to 25 inches; extremely gravelly sandy clay loam
R—25 inches; bedrock

Minor Components in Map Unit 587

Swedesflat and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Hydric soil status: Not hydric

Flanly and similar soils
Composition: 3 percent
Slope: 30 to 50 percent

Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on intrusive igneous and metamorphic hills
Hydric soil status: Not hydric

588—Ultic Haploxeralfs, thermic, high terrace, 2 to 15 percent slopes

Map Unit Setting

General location: Southeastern Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 400 to 800 feet (122 to 244 meters)
Mean annual precipitation: 28 to 30 inches (711 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Ultic Haploxeralfs, thermic, high terrace—95 percent
Minor components—5 percent

Characteristics of Ultic Haploxeralfs, Thermic, High Terrace

Slope: 2 to 15 percent
Geomorphic position: Dissected high terraces
Parent material: Loamy alluvium over loamy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Blue oak and annual grasses and forbs, with some foothill pine, whiteleaf manzanita, and buckbrush
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (cemented horizon): 20 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 10 to 60 inches
Available water capacity: Low (about 2.8 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
BAt—2 to 6 inches; gravelly loam

Bt1—6 to 12 inches; very gravelly loam
Bt2—12 to 20 inches; very gravelly loam
Bt3—20 to 32 inches; extremely gravelly clay loam
Bq1—32 to 39 inches; extremely gravelly loam
Bq2—39 to 50 inches; extremely gravelly sandy clay loam

Minor Components in Map Unit 588

Palexeralfs, clayey-skeletal, and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Dissected high terraces
Hydric soil status: Not hydric

589—Ultic Haploxeralfs, thermic, high terrace, 15 to 30 percent slopes

Map Unit Setting

General location: Southeastern Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 400 to 800 feet (122 to 244 meters)
Mean annual precipitation: 28 to 30 inches (711 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Ultic Haploxeralfs, thermic, high terrace—95 percent
Minor components—5 percent

Characteristics of Ultic Haploxeralfs, Thermic, High Terrace

Slope: 15 to 30 percent
Geomorphic position: Risers on dissected high terraces
Parent material: Loamy alluvium over loamy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Blue oak and annual grasses and forbs, with some foothill pine, whiteleaf manzanita, and buckbrush
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Depth to a restrictive feature (cemented horizon): 20 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 10 to 60 inches
Available water capacity: Low (about 2.8 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1

Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
BAt—2 to 6 inches; gravelly loam
Bt1—6 to 12 inches; very gravelly loam
Bt2—12 to 20 inches; very gravelly loam
Bt3—20 to 32 inches; extremely gravelly clay loam
Bq1—32 to 39 inches; extremely gravelly loam
Bq2—39 to 50 inches; extremely gravelly sandy clay loam

Minor Components in Map Unit 589

Palexeralfs, clayey-skeletal, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Risers on dissected high terraces
Hydric soil status: Not hydric

590—Vistarobles-Redding-Argonaut taxadjunct-Haploxererts complex, 0 to 9 percent slopes

Map Unit Setting

General location: Southeastern Butte County and northwestern Yuba County
Major uses: Livestock grazing, homesite development, watershed, and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley, Northern Sierra Nevada foothills
Elevation: 110 to 350 feet (34 to 107 meters)
Mean annual precipitation: 20 to 23 inches (508 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Vistarobles sandy loam—30 percent
Redding loam—25 percent
Argonaut taxadjunct loam—20 percent
Haploxererts gravelly silty clay—15 percent
Minor components—10 percent

Characteristics of Vistarobles Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces
Parent material: Loamy alluvium over clayey and gravelly alluvium over cemented, sandy and gravelly alluvium over sandy and cobbly and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, rounded gravel, 0 to 15 percent rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Storie index: 10 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 5 inches; sandy loam
A2—5 to 10 inches; sandy clay loam
2Bt—10 to 14 inches; gravelly clay
3Bqm—14 to 34 inches; cemented, gravelly duripan
3C—34 to 40 inches; very cobbly sandy loam

Characteristics of Redding Loam

Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 24 to 40 inches
Available water capacity: Moderate (about 5.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 32 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A1—0 to 4 inches; loam
A2—4 to 11 inches; loam
BA—11 to 24 inches; loam
2Bt—24 to 35 inches; clay
3Bqm—35 to 40 inches; cemented, very gravelly duripan

Characteristics of Argonaut Taxadjunct Loam

Slope: 0 to 9 percent
Geomorphic position: Metamorphic hills

Parent material: Loamy residuum over clayey residuum weathered from metavolcanic rocks
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-4
Land capability, nonirrigated: 3e-4
Storie index: 49 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 8 inches; clay loam
Bt2—8 to 14 inches; clay
Bt3—14 to 20 inches; clay
BCt1—20 to 26 inches; clay
BCt2—26 to 30 inches; clay loam
Cr—30 inches; bedrock

Characteristics of Haploxererts Gravelly Silty Clay

Slope: 0 to 5 percent
Geomorphic position: Small basins and swales on intermediate terraces
Parent material: Clayey alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly silty clay
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, rounded gravel, 0 to 5 percent rounded cobbles
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 60 inches
Available water capacity: Moderate (about 5.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 17 (revised)

Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly silty clay
Bw—2 to 10 inches; gravelly clay
Bss—10 to 30 inches; gravelly clay
2BCt1—30 to 33 inches; silty clay
2BCt2—33 to 41 inches; silty clay
2Cr—41 to 44 inches; bedrock

Minor Components in Map Unit 590

Durixeralfs, loamy, and similar soils
Composition: 5 percent
Slope: 0 to 9 percent
Geomorphic position: Intermediate terraces
Hydric soil status: Not hydric

Lomarica and similar soils
Composition: 3 percent
Slope: 0 to 9 percent
Geomorphic position: Metamorphic hills
Hydric soil status: Not hydric

Haploxeralfs, fine-loamy, 40 to 60 inches deep to bedrock, and similar soils
Composition: 2 percent
Slope: 0 to 9 percent
Geomorphic position: Metamorphic hills
Hydric soil status: Not hydric

603—Oroville-Thermalito-Fernandez-Thompsonflat complex, 0 to 9 percent slopes

Map Unit Setting

General location: Central and northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, homesite development, and small olive orchards
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 110 to 255 feet (34 to 79 meters)
Mean annual precipitation: 20 to 26 inches (508 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Oroville gravelly fine sandy loam—30 percent
Thermalito sandy loam—25 percent
Fernandez sandy loam—15 percent
Thompsonflat fine sandy loam—15 percent
Minor components—15 percent

Characteristics of Oroville Gravelly Fine Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces

Parent material: Loamy and gravelly alluvium over clayey and gravelly alluvium over cemented, loamy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly fine sandy loam
Percentage of the surface covered by rock fragments: 5 to 20 percent coarse, well rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 4e-3
Land capability, nonirrigated: 4e-3
Storie index: 7 (revised)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly fine sandy loam
BAt—2 to 6 inches; gravelly sandy loam
Bt1—6 to 13 inches; gravelly clay loam
2Bt2—13 to 17 inches; gravelly clay
2Btg—17 to 23 inches; gravelly sandy clay
3Bqm1—23 to 31 inches; cemented, extremely gravelly duripan
3Bqm2—31 to 60 inches; cemented, extremely gravelly duripan

Characteristics of Thermalito Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Parent material: Loamy and gravelly alluvium over clayey and gravelly alluvium over cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, well rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 14 to 40 inches
Available water capacity: Low (about 3.7 inches)

Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 22 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; sandy loam
Bt1—2 to 6 inches; gravelly sandy loam
Bt2—6 to 12 inches; sandy clay loam
Bt3—12 to 18 inches; gravelly sandy clay loam
Bt4—18 to 23 inches; gravelly sandy clay loam
Bt5—23 to 25 inches; gravelly sandy clay loam
2Bt6—25 to 29 inches; gravelly clay
2Bt7—29 to 32 inches; gravelly clay
3Bqm—32 to 60 inches; cemented, gravelly duripan

Characteristics of Fernandez Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: The top of intermediate terraces
Parent material: Fine-loamy alluvium over clayey and gravelly alluvium over cemented, sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 2 to 15 percent medium, well rounded gravel
Depth to a restrictive feature (duripan): 60 to 81 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 40 to 80 inches
Available water capacity: High (about 8.6 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 84 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; sandy loam
Bt1—2 to 6 inches; sandy clay loam
Bt2—6 to 18 inches; sandy clay loam
2Bt3—18 to 28 inches; clay loam
2Bt4—28 to 44 inches; clay loam
2Bt5—44 to 57 inches; clay
2Bt6—57 to 65 inches; gravelly clay

2Bt7—65 to 73 inches; gravelly clay loam
3Btq—73 to 85 inches; cemented, gravelly duripan

Characteristics of Thompsonflat Fine Sandy Loam

Slope: 0 to 9 percent
Geomorphic position: Intermediate terraces
Parent material: Loamy alluvium over clayey alluvium over sandy and gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, well rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 40 to 81 inches
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-3
Land capability, nonirrigated: 3e-3
Storie index: 83 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; fine sandy loam
Bt1—3 to 7 inches; fine sandy loam
Bt2—7 to 11 inches; sandy clay loam
Bt3—11 to 15 inches; sandy clay
2Bt4—15 to 22 inches; gravelly sandy clay
3Btq1—22 to 35 inches; extremely gravelly sandy clay loam
3Btq2—35 to 45 inches; extremely gravelly coarse sandy loam
3Btq3—45 to 53 inches; extremely gravelly coarse sandy loam
3Btq4—53 to 66 inches; extremely gravelly coarse sandy loam
3Btq5—66 to 80 inches; extremely gravelly coarse sandy loam

Minor Components in Map Unit 603

Vistarobles and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Hydric

Loamy soils that are 10 to 20 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Hydric

Palexeralfs, fine, more than 60 inches deep, and similar soils
Composition: 2 percent
Slope: 0 to 9 percent
Geomorphic position: The top of intermediate terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 percent
Geomorphic position: Vernal pools on intermediate terraces
Hydric soil status: Hydric

Aquerts, fine, with a duripan at a depth of 20 to 40 inches, and similar soils
Composition: 1 percent
Slope: 0 percent
Geomorphic position: Vernal pools on intermediate terraces
Hydric soil status: Hydric

Fine-loamy soils that are 20 to 40 inches deep to a duripan
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Not hydric

Redding and similar soils
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Hydric soil status: Not hydric

Fine textured soils that are deep to a duripan and similar soils
Composition: 1 percent
Slope: 0 to 5 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Not hydric

Fine-loamy soils that are deep to a duripan and similar soils
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Hydric soil status: Not hydric

Loamy-skeletal soils that are moderately deep to a duripan and similar soils
Composition: 1 percent
Slope: 0 to 9 percent
Geomorphic position: Mounds on intermediate terraces
Hydric soil status: Not hydric

Clayey-skeletal soils that are shallow to a duripan and similar soils
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Swales on intermediate terraces
Hydric soil status: Hydric

605—Duric Xerarents-Oroville complex, 0 to 1 percent slopes, leveled

Map Unit Setting

General location: Central Butte County
Major uses: Cropland and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 160 feet (23 to 50 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 252 days

Map Unit Composition

Duric Xerarents fine sandy loam, leveled—75 percent
Oroville gravelly fine sandy loam—20 percent
Minor components—5 percent

Characteristics of Duric Xerarents Fine Sandy Loam, Leveled

Slope: 0 to 1 percent
Geomorphic position: Leveled land on intermediate terraces
Parent material: Human-transported, loamy alluvium derived from igneous and metamorphic rocks over cemented, extremely gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and rice
Surface feature: The surface has been leveled for agricultural production.
Texture of the surface layer: Fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, well rounded gravel
Depth to a restrictive feature (duripan): 10 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Altered hydrology:* Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
- *Annual flooding frequency:* None
- *Annual ponding frequency:* Frequent
- *Depth to a water table (zone of saturation):* 0 to 40 inches
- *Available water capacity:* Very low (about 1.5 inches)
- *Natural drainage class:* Poorly drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7w-2
- *Land capability, nonirrigated:* 7w-2
- *Storie index:* 12 (revised)
- *Hydric soil status:* Hydric
- *Hydrologic soil group:* D

Typical profile
- Ap—0 to 5 inches; fine sandy loam
- C/Bt/Bqm—5 to 12 inches; clay and very gravelly sandy loam
- 2Bqmb—12 to 18 inches; cemented, extremely gravelly duripan

Characteristics of Oroville Gravelly Fine Sandy Loam

Slope: 0 to 1 percent
Geomorphic position: Mostly undisturbed areas on leveled land on intermediate terraces
Parent material: Loamy and gravelly alluvium over clayey and gravelly alluvium over cemented, loamy and extremely gravelly alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs and rice
Surface feature: The surface has been leveled for agricultural production.
Texture of the surface layer: Gravelly fine sandy loam
Percentage of the surface covered by rock fragments: 5 to 20 percent coarse, well rounded gravel
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Altered hydrology: Drainage and irrigation ditches have modified the natural depth to a water table. Roads, ditches, leveling, and urban construction have modified natural overland flow patterns, runoff, and the depth, frequency, and duration of ponding.
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 2.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6s-2
Land capability, nonirrigated: 6s-2
Storie index: 7 (revised)
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly fine sandy loam
BAt—2 to 6 inches; gravelly sandy loam
Bt1—6 to 13 inches; gravelly clay loam
2Bt2—13 to 17 inches; gravelly clay
2Btg—17 to 23 inches; gravelly sandy clay
3Bqm1—23 to 31 inches; cemented, extremely gravelly duripan
3Bqm2—31 to 60 inches; cemented, extremely gravelly duripan

Minor Components in Map Unit 605

Extremely altered soils in cut areas
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled land on intermediate terraces
Hydric soil status: Hydric

Altered soils with up to 3 feet of fill on the surface
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Leveled land on intermediate terraces
Hydric soil status: Not hydric

606—Redtough-Fallager-Anita, gravelly duripan, complex, 0 to 3 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 160 to 395 feet (50 to 121 meters)
Mean annual precipitation: 23 to 26 inches (584 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Redtough loam—45 percent
Fallager loam—30 percent
Anita gravelly clay, gravelly duripan—15 percent
Minor components—10 percent

Characteristics of Redtough Loam

Slope: 0 to 3 percent
Geomorphic position: Mounds on fan terraces
Parent material: Loamy alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, well rounded gravel, 0 to 10 percent well rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 1.6 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Storie index: 11 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; loam
Bt1—1 to 7 inches; gravelly loam
Bt2—7 to 13 inches; very cobbly loam
Bqm—13 inches; cemented, very gravelly duripan

Characteristics of Fallager Loam

Slope: 0 to 3 percent
Geomorphic position: Swales on fan terraces

Parent material: Loamy alluvium over clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, rounded gravel, 0 to 25 percent rounded cobbles
Depth to a restrictive feature (duripan): 4 to 10 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Storie index: 5 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; loam
Bt1—1 to 3 inches; gravelly clay loam
2Bt2—3 to 7 inches; gravelly clay
3Bqm—7 inches; cemented, gravelly duripan

Characteristics of Anita Gravelly Clay, Gravelly Duripan

Slope: 0 to 3 percent
Geomorphic position: Swales on fan terraces
Parent material: Clayey alluvium over cemented, sandy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Surface feature: Surface cracking occurs when the soil is dry.
Texture of the surface layer: Gravelly clay
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, rounded gravel, 0 to 25 percent rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6s-5
Land capability, nonirrigated: 6s-5
Storie index: 2 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly clay
Bss1—3 to 8 inches; gravelly clay
Bss2—8 to 15 inches; gravelly clay
2Bkqm—15 inches; cemented, gravelly duripan

Minor Components in Map Unit 606

Galt clay and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Swales on fan terraces
Hydric soil status: Hydric

Areas where the duripan crops out
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Fan terraces
Hydric soil status: Not hydric

Clayey soils that are less than 10 inches deep to a duripan
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Swales on fan terraces
Hydric soil status: Hydric

Loamy or clayey soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on fan terraces
Hydric soil status: Hydric

Tuscan gravelly loam and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on fan terraces
Hydric soil status: Not hydric

609—Anita, gravelly duripan-Tuscan taxadjunct complex, 0 to 2 percent slopes

Map Unit Setting

General location: Northwestern Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 190 to 295 feet (58 to 91 meters)
Mean annual precipitation: 25 to 27 inches (635 to 686 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Anita gravelly clay, gravelly duripan—50 percent
Tuscan taxadjunct gravelly clay loam—40 percent
Minor components—10 percent

Characteristics of Anita Gravelly Clay, Gravelly Duripan

Slope: 0 to 2 percent
Geomorphic position: Clay flats and swales on fan terraces
Parent material: Clayey alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly clay
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, rounded gravel, 0 to 60 percent rounded cobbles
Depth to a restrictive feature (duripan): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Storie index: 3 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly clay
Bss1—3 to 8 inches; gravelly clay
Bss2—8 to 15 inches; gravelly clay
2Bkqm—15 inches; gravelly duripan

Characteristics of Tuscan Taxadjunct Gravelly Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Mounds on fan terraces
Parent material: Clayey alluvium over cemented, cobbly and gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly clay loam
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, rounded gravel, 0 to 10 percent rounded cobbles
Depth to a restrictive feature (duripan): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 40 inches
Available water capacity: Low (about 3.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-8
Land capability, nonirrigated: 5w-8

Storie index: 15 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly clay loam
Bt1—2 to 5 inches; gravelly clay
Bt2—5 to 13 inches; gravelly clay
Bt3—13 to 23 inches; gravelly clay loam
Bt4—23 to 29 inches; very gravelly clay loam
2Bqm—29 inches; cemented, extremely cobbly duripan

Minor Components in Map Unit 609

Galt and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Clay flats on fan terraces
Hydric soil status: Hydric

Wafap and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on fan terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on fan terraces
Hydric soil status: Hydric

Tuscan and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Mounds on fan terraces
Hydric soil status: Not hydric

614—Doemill-Jokerst complex, 0 to 3 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 160 to 520 feet (50 to 160 meters)
Mean annual precipitation: 25 to 29 inches (635 to 737 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Doemill gravelly loam—50 percent
Jokerst very cobbly loam—40 percent
Minor components—10 percent

Characteristics of Doemill Gravelly Loam

Slope: 0 to 3 percent
Geomorphic position: Mounds on ridgetops and strath terraces on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6s-8
Land capability, nonirrigated: 6s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Jokerst Very Cobbly Loam

Slope: 0 to 3 percent
Geomorphic position: Swales on ridgetops and strath terraces on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8

Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Minor Components in Map Unit 614

Rock outcrop
Composition: 5 percent
Slope: 0 to 3 percent
Geomorphic position: Ridgetops and strath terraces on volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Ridgetops and strath terraces on volcanic ridges
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on ridgetops and strath terraces on volcanic ridges
Hydric soil status: Hydric

615—Doemill-Jokerst complex, 3 to 8 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 160 to 1,000 feet (50 to 305 meters)
Mean annual precipitation: 25 to 29 inches (635 to 737 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Doemill gravelly loam—50 percent
Jokerst very cobbly loam—40 percent
Minor components—10 percent

Characteristics of Doemill Gravelly Loam

Slope: 3 to 8 percent
Geomorphic position: Mounds on ridgetops and strath terraces on volcanic ridges (fig. 26)
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders

Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Jokerst Very Cobbly Loam

Slope: 3 to 8 percent
Geomorphic position: Swales on ridgetops and strath terraces on volcanic ridges (fig. 26)
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs

Figure 26.—A typical area of Doemill-Jokerst complex, 3 to 8 percent slopes, showing mound and swale microtopography. Highway 99 is in the background. (Photo by Zeke Lunder)

Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Minor Components in Map Unit 615

Rock outcrop
Composition: 6 percent
Slope: 3 to 8 percent
Geomorphic position: Ridgetops and strath terraces on volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 3 percent
Slope: 3 to 8 percent
Geomorphic position: Ridgetops and strath terraces on volcanic ridges
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on ridgetops and strath terraces on volcanic ridges
Hydric soil status: Hydric

616—Jokerst-Doemill-Typic Haploxeralfs complex, 8 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, homesite development, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 160 to 1,115 feet (50 to 341 meters)
Mean annual precipitation: 25 to 29 inches (635 to 737 millimeters)

Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Jokerst very cobbly loam—35 percent
Doemill gravelly loam—35 percent
Typic Haploxeralfs gravelly loam—15 percent
Minor components—15 percent

Characteristics of Jokerst Very Cobbly Loam

Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes and backslopes on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Characteristics of Doemill Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes and backslopes on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 4 to 20 inches

Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Typic Haploxeralfs Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes and backslopes on volcanic ridges
Parent material: Loamy colluvium derived from volcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to lithic bedrock; 20 to 60 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; gravelly clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Bt3—16 to 27 inches; very gravelly clay loam
Bt4—27 to 40 inches; very gravelly clay loam
2Cr—40 inches; bedrock

Minor Components in Map Unit 616

Rock outcrop
Composition: 10 percent
Slope: 8 to 15 percent

Geomorphic position: Shoulder slopes and backslopes on volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes and backslopes on volcanic ridges
Hydric soil status: Not hydric

617—Jokerst-Doemill-Typic Haploxeralfs complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 255 to 800 feet (79 to 244 meters)
Mean annual precipitation: 25 to 29 inches (635 to 737 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Doemill gravelly loam—35 percent
Jokerst very cobbly loam—30 percent
Typic Haploxeralfs gravelly loam—20 percent
Minor components—15 percent

Characteristics of Doemill Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 6 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Jokerst Very Cobbly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Characteristics of Typic Haploxeralfs Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Loamy colluvium derived from volcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, whiteleaf manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to lithic bedrock; 20 to 60 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; gravelly clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Bt3—16 to 27 inches; very gravelly clay loam
Bt4—27 to 40 inches; very gravelly clay loam
2Cr—40 inches; bedrock

Minor Components in Map Unit 617

Rock outcrop
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

619—Carhart taxadjunct, 0 to 2 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 255 to 530 feet (79 to 162 meters)
Mean annual precipitation: 26 to 29 inches (660 to 737 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Carhart taxadjunct clay—90 percent
Minor components—10 percent

Characteristics of Carhart Taxadjunct Clay

Slope: 0 to 2 percent
Geomorphic position: Clay basins on strath terraces
Parent material: Clayey alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay

Percentage of the surface covered by rock fragments: 0 to 10 percent fine, subrounded gravel, 5 to 30 percent subrounded cobbles, 0 to 20 percent subrounded stones, 0 to 3 percent subrounded boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 4 inches; clay
Bss1—4 to 11 inches; gravelly clay
Bss2—11 to 17 inches; clay
2R—17 inches; bedrock

Minor Components in Map Unit 619

Carhart and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Clay basins on strath terraces
Hydric soil status: Hydric

Anita soils with a gravelly duripan and similar soils
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Clay basins on strath terraces
Hydric soil status: Hydric

Soils that are frequently ponded for long periods
Composition: 2 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools in clay basins on strath terraces
Hydric soil status: Hydric

Rock outcrop
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

620—Doemill-Jokerst-Ultic Haploxeralfs, thermic, complex, 3 to 8 percent slopes

Map Unit Setting

General location: North-central Butte County

Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 400 to 1,695 feet (122 to 518 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Doemill gravelly loam—40 percent
Jokerst very cobbly loam—25 percent
Ultic Haploxeralfs, thermic, gravelly loam—20 percent
Minor components—15 percent

Characteristics of Doemill Gravelly Loam

Slope: 3 to 8 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, blue oak, and buckbrush
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 2 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8
Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Jokerst Very Cobbly Loam

Slope: 3 to 8 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders

Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Characteristics of Ultic Haploxeralfs, Thermic, Gravelly Loam

Slope: 3 to 8 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, buckbrush, whiteleaf manzanita, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 20 percent fine, subangular gravel, 0 to 80 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature: 20 to 40 inches to lithic bedrock; 20 to 40 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 18 to 40 inches
Available water capacity: Low (about 3.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-8
Land capability, nonirrigated: 4e-8
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 6 inches; very cobbly clay loam
Bt2—6 to 13 inches; very cobbly clay loam
Bt3—13 to 21 inches; very cobbly clay loam
Bt4—21 to 31 inches; very cobbly clay loam
R—31 inches; bedrock

Minor Components in Map Unit 620

Rock outcrop
Composition: 10 percent
Slope: 3 to 8 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

621—Doemill-Jokerst-Ultic Haploxeralfs, thermic, complex, 8 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 400 to 1,695 feet (122 to 518 meters)
Mean annual precipitation: 28 to 40 inches (711 to 1,016 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Doemill gravelly loam—30 percent
Jokerst very cobbly loam—30 percent
Ultic Haploxeralfs, thermic, gravelly loam—20 percent
Minor components—20 percent

Characteristics of Doemill Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, blue oak, and buckbrush
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 2 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 4 to 20 inches
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-8

Land capability, nonirrigated: 6e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; gravelly loam
Bt1—1 to 5 inches; gravelly loam
Bt2—5 to 9 inches; gravelly loam
Bt3—9 to 14 inches; gravelly loam
R—14 inches; bedrock

Characteristics of Jokerst Very Cobbly Loam

Slope: 8 to 15 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs and blue oak
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 2 to 30 percent subangular cobbles, 3 to 50 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.4 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; very cobbly loam
Bt—1 to 4 inches; gravelly loam
R—4 inches; bedrock

Characteristics of Ultic Haploxeralfs, Thermic, Gravelly Loam

Slope: 8 to 15 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, interior live oak, buckbrush, whiteleaf manzanita, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 20 percent fine, subangular gravel, 0 to 80 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature: 20 to 40 inches to lithic bedrock; 20 to 40 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 19 to 40 inches
Available water capacity: Low (about 3.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-8
Land capability, nonirrigated: 4e-8
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 6 inches; very cobbly clay loam
Bt2—6 to 13 inches; very cobbly clay loam
Bt3—13 to 21 inches; very cobbly clay loam
Bt4—21 to 31 inches; very cobbly clay loam
R—31 inches; bedrock

Minor Components in Map Unit 621

Rock outcrop
Composition: 12 percent
Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes on volcanic ridges
Hydric soil status: Not hydric

Lithic Xerorthents and similar soils
Composition: 8 percent
Slope: 8 to 15 percent
Geomorphic position: Shoulder slopes on volcanic ridges
Hydric soil status: Not hydric

622—Xerorthents, shallow-Typic Haploxeralfs-Rock outcrop, cliffs, complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 200 to 1,495 feet (61 to 457 meters)
Mean annual precipitation: 26 to 38 inches (660 to 965 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Xerorthents, shallow—40 percent
Typic Haploxeralfs gravelly loam—30 percent
Rock outcrop (mudflow-breccia cliffs)—15 percent
Minor components—15 percent

Characteristics of Xerorthents, Shallow

Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Parent material: Loamy residuum and/or colluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs, buckbrush, and blue oak
Texture of the surface layer: Gravelly clay loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 40 percent subangular stones, 0 to 40 percent subangular boulders
Depth to a restrictive feature: 2 to 20 inches to paralithic bedrock; 2 to 20 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly clay loam
Bt1—2 to 5 inches; gravelly clay loam
Bt2—5 to 8 inches; very cobbly clay loam
2R—8 inches; bedrock

Characteristics of Typic Haploxeralfs Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Parent material: Loamy residuum and/or colluvium derived from volcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, buckbrush, manzanita, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; gravelly clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Bt3—16 to 27 inches; very gravelly clay loam
Bt4—27 to 40 inches; very gravelly clay loam
2Cr—40 inches; bedrock

Characteristics of Rock Outcrop (Mudflow-Breccia Cliffs)

Slope: 15 to 200 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 622

Rock outcrop
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Aquic Durixeralfs and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Drainageways on side slopes in canyons
Hydric soil status: Hydric

623—Xerorthents, shallow-Typic Haploxeralfs-Rock outcrop, cliffs, complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 295 to 1,495 feet (91 to 457 meters)
Mean annual precipitation: 26 to 38 inches (660 to 965 millimeters)
Mean annual air temperature: 59 to 63 degrees F (15 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Xerorthents, shallow—40 percent
Typic Haploxeralfs gravelly loam—25 percent
Rock outcrop (mudflow-breccia cliffs)—20 percent
Minor components—15 percent

Characteristics of Xerorthents, Shallow

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum and/or colluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs, buckbrush, and blue oak
Texture of the surface layer: Gravelly clay loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 40 percent subangular stones, 0 to 40 percent subangular boulders
Depth to a restrictive feature: 2 to 20 inches to paralithic bedrock; 2 to 20 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly clay loam
Bt1—2 to 5 inches; gravelly clay loam
Bt2—5 to 8 inches; very cobbly clay loam
2R—8 inches; bedrock

Characteristics of Typic Haploxeralfs Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum and/or colluvium derived from volcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, buckbrush, manzanita, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; gravelly clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Bt3—16 to 27 inches; very gravelly clay loam
Bt4—27 to 40 inches; very gravelly clay loam
2Cr—40 inches; bedrock

Characteristics of Rock Outcrop (Mudflow-Breccia Cliffs)

Slope: 30 to 200 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 623

Rock outcrop
Composition: 10 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Aquic Durixeralfs and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Drainageways on backslopes in canyons
Hydric soil status: Hydric

624—Ultic Haploxeralfs, mesic-Rockstripe complex, 2 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 895 to 2,200 feet (274 to 671 meters)
Mean annual precipitation: 35 to 55 inches (889 to 1,397 millimeters)

Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 235 to 260 days

Map Unit Composition

Ultic Haploxeralfs, mesic, gravelly loam—60 percent
Rockstripe very gravelly loam—25 percent
Minor components—15 percent

Characteristics of Ultic Haploxeralfs, Mesic, Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Foothill pine, California black oak, whiteleaf manzanita, buckbrush, scrub oak, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to lithic bedrock; 20 to 60 inches to paralithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-3
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; cobbly loam
Bt2—9 to 23 inches; very stony clay loam
Bt3—23 to 32 inches; very cobbly clay loam
Bt4—32 to 42 inches; extremely stony clay loam
Cr—42 inches; bedrock

Characteristics of Rockstripe Very Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, buckbrush, whiteleaf manzanita, Pacific poison oak, and foothill pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent medium,

subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very cobbly loam
Bt2—6 to 9 inches; cobbly loam
R—9 inches; bedrock

Minor Components in Map Unit 624

Rock outcrop
Composition: 8 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Schott and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lithic Dystroxerepts and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

625—Ultic Haploxeralfs, mesic-Rockstripe complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 495 to 2,595 feet (152 to 792 meters)
Mean annual precipitation: 35 to 62 inches (889 to 1,575 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 225 to 260 days

Map Unit Composition

Ultic Haploxeralfs, mesic, gravelly loam—50 percent
Rockstripe very gravelly loam—35 percent
Minor components—15 percent

Characteristics of Ultic Haploxeralfs, Mesic, Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy colluvium and/or residuum weathered from volcanic breccia
Observed vegetation: Foothill pine, California black oak, whiteleaf manzanita, buckbrush, scrub oak, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; cobbly loam
Bt2—9 to 23 inches; very stony clay loam
Bt3—23 to 32 inches; very cobbly clay loam
Bt4—32 to 42 inches; extremely stony clay loam
Cr—42 inches; bedrock

Characteristics of Rockstripe Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, buckbrush, whiteleaf manzanita, Pacific poison oak, and foothill pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very cobbly loam
Bt2—6 to 9 inches; cobbly loam
R—9 inches; bedrock

Minor Components in Map Unit 625

Rock outcrop
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Schott and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Lithic Dystroxerepts and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

626—Ultic Haploxeralfs-Rockstripe-Rock outcrop, cliffs, complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 600 to 2,495 feet (183 to 762 meters)
Mean annual precipitation: 30 to 60 inches (762 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 200 to 260 days

Map Unit Composition

Ultic Haploxeralfs gravelly loam—40 percent
Rockstripe very gravelly loam—35 percent
Rock outcrop (mudflow-breccia cliffs)—15 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy colluvium derived from volcanic rocks
Observed vegetation: Foothill pine, live oak, California black oak, scrub oak, Pacific poison oak, California laurel, whiteleaf manzanita, toyon, and deerbrush
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 4 inches; gravelly loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 18 inches; gravelly clay loam
Bt3—18 to 35 inches; gravelly clay loam
Bt4—35 to 48 inches; gravelly clay
Crt—48 inches; bedrock

Characteristics of Rockstripe Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, buckbrush, whiteleaf manzanita, Pacific poison oak, and foothill pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very cobbly loam
Bt2—6 to 9 inches; cobbly loam
R—9 inches; bedrock

Characteristics of Rock Outcrop (Mudflow-Breccia Cliffs)

Slope: 30 to 200 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 626

Tusccoll and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 3 percent

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Dystroxerepts and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

627—Ultic Haploxeralfs-Rockstripe-Rock outcrop, cliffs, complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 245 to 2,595 feet (76 to 792 meters)
Mean annual precipitation: 26 to 55 inches (660 to 1,397 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 200 to 260 days

Map Unit Composition

Ultic Haploxeralfs gravelly loam—40 percent
Rockstripe very gravelly loam—35 percent
Rock outcrop (mudflow-breccia cliffs)—15 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy colluvium derived from volcanic rocks
Observed vegetation: Foothill pine, live oak, California black oak, scrub oak, Pacific poison oak, California laurel, whiteleaf manzanita, toyon, and deerbrush
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.5 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 4 inches; gravelly loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 18 inches; gravelly clay loam
Bt3—18 to 35 inches; gravelly clay loam
Bt4—35 to 48 inches; gravelly clay
Crt—48 inches; bedrock

Characteristics of Rockstripe Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, buckbrush, whiteleaf manzanita, Pacific poison oak, and foothill pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very cobbly loam
Bt2—6 to 9 inches; cobbly loam
R—9 inches; bedrock

Characteristics of Rock Outcrop (Mudflow-Breccia Cliffs)

Slope: 50 to 200 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 627

Tusccoll and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Dystroxerepts and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

628—Rockstripe-Ultic Haploxeralfs-Rock outcrop, cliffs, complex, 70 to 100 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 295 to 2,400 feet (91 to 732 meters)
Mean annual precipitation: 26 to 60 inches (660 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 215 to 260 days

Map Unit Composition

Rockstripe very gravelly loam—40 percent
Ultic Haploxeralfs gravelly loam—35 percent
Rock outcrop (mudflow-breccia cliffs)—20 percent
Minor components—5 percent

Characteristics of Rockstripe Very Gravelly Loam

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Annual grasses and forbs, buckbrush, whiteleaf manzanita, Pacific poison oak, and foothill pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders

Depth to a restrictive feature (lithic bedrock): 2 to 10 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very cobbly loam
Bt2—6 to 9 inches; cobbly loam
R—9 inches; bedrock

Characteristics of Ultic Haploxeralfs Gravelly Loam

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy colluvium derived from volcanic rocks
Observed vegetation: Foothill pine, live oak, California black oak, scrub oak, Pacific poison oak, California laurel, whiteleaf manzanita, toyon, and deerbrush
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 4 inches; gravelly loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 18 inches; gravelly clay loam
Bt3—18 to 35 inches; gravelly clay loam

Bt4—35 to 48 inches; gravelly clay
Crt—48 inches; bedrock

Characteristics of Rock Outcrop (Mudflow-Breccia Cliffs)

Slope: 70 to 200 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 628

Tusccoll and similar soils
Composition: 3 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 1 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Dystroxerepts and similar soils
Composition: 1 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

629—Slideland gravelly loam, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 415 to 1,875 feet (128 to 573 meters)
Mean annual precipitation: 30 to 60 inches (762 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 215 to 260 days

Map Unit Composition

Slideland gravelly loam—80 percent
Minor components—20 percent

Characteristics of Slideland Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Parent material: Stream-worked, fine-loamy colluvium derived from volcanic and sedimentary rocks
Observed vegetation: Annual grasses and forbs, California black oak, bigleaf maple, canyon live oak, valley oak, ponderosa pine, foothill pine, blue oak, whiteleaf manzanita, toyon, California laurel, deerbrush, and California buckthorn
Texture of the surface layer: Gravelly loam

Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 9 inches; gravelly loam
Bt2—9 to 14 inches; gravelly clay loam
Bt3—14 to 21 inches; gravelly clay loam
Bt4—21 to 28 inches; gravelly clay loam
Bt5—28 to 38 inches; gravelly clay loam
Bt6—38 to 51 inches; gravelly clay loam
Bt7—51 to 69 inches; very cobbly clay loam
Bt8—69 to 80 inches; very cobbly clay loam

Minor Components in Map Unit 629

Chinacamp and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Fine textured soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Soils that are less than 60 inches deep to bedrock
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Coalcanyon taxadjunct and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Haploxeralfs, terrace, and similar soils
Composition: 2 percent
Slope: 3 to 6 percent
Geomorphic position: Stream terraces in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Typic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Seeps
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Hydric

630—Slideland gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 600 to 1,860 feet (183 to 567 meters)
Mean annual precipitation: 41 to 60 inches (1,041 to 1,524 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 215 to 240 days

Map Unit Composition

Slideland gravelly loam—80 percent
Minor components—20 percent

Characteristics of Slideland Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Parent material: Stream-worked, fine-loamy colluvium derived from volcanic and sedimentary rocks
Observed vegetation: Annual grasses and forbs, California black oak, bigleaf maple, canyon live oak, valley oak, ponderosa pine, foothill pine, blue oak, whiteleaf manzanita, toyon, California laurel, deerbrush, and California buckthorn
Texture of the surface layer: Gravelly loam

Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 9 inches; gravelly loam
Bt2—9 to 14 inches; gravelly clay loam
Bt3—14 to 21 inches; gravelly clay loam
Bt4—21 to 28 inches; gravelly clay loam
Bt5—28 to 38 inches; gravelly clay loam
Bt6—38 to 51 inches; gravelly clay loam
Bt7—51 to 69 inches; very cobbly clay loam
Bt8—69 to 80 inches; very cobbly clay loam

Minor Components in Map Unit 630

Chinacamp and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Fine textured soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Soils that are less than 60 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Coalcanyon taxadjunct and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent

Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Typic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

631—Slideland gravelly loam, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 560 to 2,000 feet (171 to 610 meters)
Mean annual precipitation: 37 to 60 inches (940 to 1,524 millimeters)
Mean annual air temperature: 55 to 59 degrees F (13 to 15 degrees C)
Frost-free period: 215 to 255 days

Map Unit Composition

Slideland gravelly loam—80 percent
Minor components—20 percent

Characteristics of Slideland Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Parent material: Stream-worked, fine-loamy colluvium derived from volcanic and sedimentary rocks
Observed vegetation: Annual grasses and forbs, California black oak, bigleaf maple, canyon live oak, valley oak, ponderosa pine, foothill pine, blue oak, whiteleaf manzanita, toyon, California laurel, deerbrush, and California buckthorn
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 9.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 9 inches; gravelly loam
Bt2—9 to 14 inches; gravelly clay loam
Bt3—14 to 21 inches; gravelly clay loam
Bt4—21 to 28 inches; gravelly clay loam
Bt5—28 to 38 inches; gravelly clay loam
Bt6—38 to 51 inches; gravelly clay loam
Bt7—51 to 69 inches; very cobbly clay loam
Bt8—69 to 80 inches; very cobbly clay loam

Minor Components in Map Unit 631

Chinacamp and similar soils
Composition: 8 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Soils that are less than 60 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Fine textured soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Coalcanyon taxadjunct and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Typic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 1 percent
Slope: 30 to 50 percent

Geomorphic position: Side slopes on benches in canyons
Hydric soil status: Not hydric

632—Ultic Haploxeralfs, conglomerate, complex, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Areas of marine conglomerate exposed in Southern Cascade foothills
Elevation: 695 to 1,800 feet (213 to 549 meters)
Mean annual precipitation: 37 to 65 inches (940 to 1,651 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 190 to 260 days

Map Unit Composition

Ultic Haploxeralfs, conglomerate, very deep—50 percent
Ultic Haploxeralfs, conglomerate, moderately deep—40 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Conglomerate, Very Deep

Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Parent material: Gravelly residuum weathered from marine conglomerate
Observed vegetation: California black oak, foothill pine, canyon live oak, blue oak, Pacific poison oak, toyon, scrub oak, manzanita, annual grasses and forbs, and scattered ponderosa pine and Douglas-fir
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 10 percent rounded cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 6 inches; gravelly clay loam

Bt1—6 to 10 inches; gravelly clay loam
Bt2—10 to 17 inches; clay loam
Bt3—17 to 28 inches; cobbly clay loam
Bt4—28 to 40 inches; very cobbly clay loam
2Bt5—40 to 50 inches; very gravelly clay
2Bt6—50 to 71 inches; very gravelly sandy clay loam
2Bt7—71 to 84 inches; very gravelly sandy clay loam

Characteristics of Ultic Haploxeralfs, Conglomerate, Moderately Deep

Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Parent material: Gravelly residuum weathered from marine conglomerate
Observed vegetation: Canyon live oak, blue oak, manzanita, toyon, foothill pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 5 inches; very gravelly loam
Bt1—5 to 10 inches; very gravelly clay loam
Bt2—10 to 25 inches; extremely gravelly sandy clay loam
Cr—25 inches; bedrock

Minor Components in Map Unit 632

Soils that are 40 to 60 inches deep to bedrock
Composition: 8 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

633—Ultic Haploxeralfs, conglomerate, complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine conglomerate exposed in Southern Cascade foothills
Elevation: 695 to 1,800 feet (213 to 549 meters)
Mean annual precipitation: 37 to 65 inches (940 to 1,651 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 190 to 260 days

Map Unit Composition

Ultic Haploxeralfs, conglomerate, very deep—60 percent
Ultic Haploxeralfs, conglomerate, moderately deep—30 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Conglomerate, Very Deep

Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Parent material: Gravelly colluvium derived from marine conglomerate
Observed vegetation: California black oak, foothill pine, canyon live oak, blue oak, Pacific poison oak, toyon, scrub oak, manzanita, annual grasses and forbs, and scattered ponderosa pine and Douglas-fir
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 10 percent rounded cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; gravelly clay loam
Bt1—6 to 10 inches; gravelly clay loam
Bt2—10 to 17 inches; clay loam

Bt3—17 to 28 inches; cobbly clay loam
Bt4—28 to 40 inches; very cobbly clay loam
2Bt5—40 to 50 inches; very gravelly clay
2Bt6—50 to 71 inches; very gravelly sandy clay loam
2Bt7—71 to 84 inches; very gravelly sandy clay loam

Characteristics of Ultic Haploxeralfs, Conglomerate, Moderately Deep

Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Parent material: Gravelly residuum weathered from marine conglomerate
Observed vegetation: Canyon live oak, blue oak, manzanita, toyon, foothill pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 5 inches; very gravelly loam
Bt1—5 to 10 inches; very gravelly clay loam
Bt2—10 to 25 inches; extremely gravelly sandy clay loam
Cr—25 inches; bedrock

Minor Components in Map Unit 633

Soils that are 40 to 60 inches deep to bedrock
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

634—Ultic Haploxeralfs, conglomerate, complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine conglomerate exposed in Southern Cascade foothills
Elevation: 695 to 1,695 feet (213 to 518 meters)
Mean annual precipitation: 37 to 65 inches (940 to 1,651 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 190 to 260 days

Map Unit Composition

Ultic Haploxeralfs, conglomerate, very deep—60 percent
Ultic Haploxeralfs, conglomerate, moderately deep—30 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Conglomerate, Very Deep

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Gravelly colluvium derived from marine conglomerate
Observed vegetation: California black oak, foothill pine, canyon live oak, blue oak, Pacific poison oak, toyon, scrub oak, manzanita, annual grasses and forbs, and scattered ponderosa pine and Douglas-fir
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 10 percent rounded cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; gravelly clay loam
Bt1—6 to 10 inches; gravelly clay loam
Bt2—10 to 17 inches; clay loam
Bt3—17 to 28 inches; cobbly clay loam
Bt4—28 to 40 inches; very cobbly clay loam
2Bt5—40 to 50 inches; very gravelly clay

2Bt6—50 to 71 inches; very gravelly sandy clay loam
2Bt7—71 to 84 inches; very gravelly sandy clay loam

Characteristics of Ultic Haploxeralfs, Conglomerate, Moderately Deep

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Gravelly colluvium and/or residuum weathered from marine conglomerate
Observed vegetation: Canyon live oak, blue oak, manzanita, toyon, foothill pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Storie index: 0 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 5 inches; very gravelly loam
Bt1—5 to 10 inches; very gravelly clay loam
Bt2—10 to 25 inches; extremely gravelly sandy clay loam
Cr—25 inches; bedrock

Minor Components in Map Unit 634

Soils that are 40 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Tusccoll and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

635—Ultic Haploxeralfs, conglomerate, complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine conglomerate exposed in Southern Cascade foothills
Elevation: 1,000 to 1,695 feet (305 to 518 meters)
Mean annual precipitation: 55 to 65 inches (1,397 to 1,651 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 190 to 230 days

Map Unit Composition

Ultic Haploxeralfs, conglomerate, very deep—50 percent
Ultic Haploxeralfs, conglomerate, moderately deep—40 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Conglomerate, Very Deep

Slope: 50 to 70 percent
Geomorphic position: Drainageways in canyons
Parent material: Gravelly colluvium derived from marine conglomerate
Observed vegetation: California black oak, foothill pine, canyon live oak, blue oak, Pacific poison oak, toyon, scrub oak, manzanita, annual grasses and forbs, and scattered ponderosa pine and Douglas-fir
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 10 percent rounded cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; gravelly clay loam
Bt1—6 to 10 inches; gravelly clay loam
Bt2—10 to 17 inches; clay loam
Bt3—17 to 28 inches; cobbly clay loam
Bt4—28 to 40 inches; very cobbly clay loam
2Bt5—40 to 50 inches; very gravelly clay

2Bt6—50 to 71 inches; very gravelly sandy clay loam
2Bt7—71 to 84 inches; very gravelly sandy clay loam

Characteristics of Ultic Haploxeralfs, Conglomerate, Moderately Deep

Slope: 50 to 70 percent
Geomorphic position: Drainageways in canyons
Parent material: Gravelly colluvium and/or residuum weathered from marine conglomerate
Observed vegetation: Canyon live oak, blue oak, manzanita, toyon, foothill pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 5 inches; very gravelly loam
Bt1—5 to 10 inches; very gravelly clay loam
Bt2—10 to 25 inches; extremely gravelly sandy clay loam
Cr—25 inches; bedrock

Minor Components in Map Unit 635

Tusccoll and similar soils
Composition: 6 percent
Slope: 50 to 70 percent
Geomorphic position: Drainageways in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Drainageways in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Drainageways in canyons
Hydric soil status: Not hydric

636—Ultic Haploxeralfs, conglomerate, complex, 70 to 100 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine conglomerate exposed in Southern Cascade foothills
Elevation: 1,000 to 1,600 feet (305 to 488 meters)
Mean annual precipitation: 58 to 60 inches (1,473 to 1,524 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 215 days

Map Unit Composition

Ultic Haploxeralfs, conglomerate, moderately deep—50 percent
Ultic Haploxeralfs, conglomerate, very deep—40 percent
Minor components—10 percent

Characteristics of Ultic Haploxeralfs, Conglomerate, Moderately Deep

Slope: 70 to 100 percent
Geomorphic position: Ravines in canyons
Parent material: Gravelly colluvium and/or residuum weathered from marine conglomerate
Observed vegetation: Canyon live oak, blue oak, manzanita, toyon, foothill pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 1.4 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 8
- *Land capability, nonirrigated:* 8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 5 inches; very gravelly loam
- Bt1—5 to 10 inches; very gravelly clay loam
- Bt2—10 to 25 inches; extremely gravelly sandy clay loam
- Cr—25 inches; bedrock

Characteristics of Ultic Haploxeralfs, Conglomerate, Very Deep

Slope: 70 to 100 percent
Geomorphic position: Ravines in canyons
Parent material: Gravelly colluvium derived from marine conglomerate
Observed vegetation: California black oak, foothill pine, canyon live oak, blue oak, Pacific poison oak, toyon, scrub oak, manzanita, annual grasses and forbs, and scattered ponderosa pine and Douglas-fir
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 10 percent rounded cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; gravelly clay loam
Bt1—6 to 10 inches; gravelly clay loam
Bt2—10 to 17 inches; clay loam
Bt3—17 to 28 inches; cobbly clay loam
Bt4—28 to 40 inches; very cobbly clay loam
2Bt5—40 to 50 inches; very gravelly clay
2Bt6—50 to 71 inches; very gravelly sandy clay loam
2Bt7—71 to 84 inches; very gravelly sandy clay loam

Minor Components in Map Unit 636

Tusccoll and similar soils
Composition: 6 percent
Slope: 70 to 100 percent
Geomorphic position: Ravines in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 70 to 100 percent
Geomorphic position: Ravines in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 2 percent
Slope: 70 to 100 percent

Geomorphic position: Ravines in canyons
Hydric soil status: Not hydric

637—Ultic Haploxeralfs, sandstone, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 1,000 to 1,475 feet (305 to 451 meters)
Mean annual precipitation: 58 inches (1,473 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 220 days

Map Unit Composition

Ultic Haploxeralfs, sandstone—80 percent
Minor components—20 percent

Characteristics of Ultic Haploxeralfs, Sandstone

Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Parent material: Sandy colluvium and/or residuum weathered from marine sandstone
Observed vegetation: Canyon live oak, blue oak, California black oak, foothill pine, manzanita, deerbrush, California laurel, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; very fine sandy loam
Bt1—2 to 6 inches; very fine sandy loam
Bt2—6 to 11 inches; very fine sandy loam
Bt3—11 to 17 inches; very fine sandy loam

Bt4—17 to 24 inches; very fine sandy loam
2Bt5—24 to 32 inches; very gravelly very fine sandy loam
2Cr/Bt—32 to 53 inches; very gravelly sandy clay loam
2Cr1—53 to 65 inches; bedrock
2Cr2—65 inches; bedrock

Minor Components in Map Unit 637

Soils that are less than 40 inches deep to bedrock
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

638—Ultic Haploxeralfs, sandstone, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 1,200 to 2,000 feet (366 to 610 meters)
Mean annual precipitation: 58 inches (1,473 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 220 days

Map Unit Composition

Ultic Haploxeralfs, sandstone—80 percent
Minor components—20 percent

Characteristics of Ultic Haploxeralfs, Sandstone

Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Parent material: Sandy colluvium and/or residuum weathered from marine sandstone
Observed vegetation: Canyon live oak, blue oak, California black oak, foothill pine, manzanita, deerbrush, California laurel, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; very fine sandy loam
Bt1—2 to 6 inches; very fine sandy loam
Bt2—6 to 11 inches; very fine sandy loam
Bt3—11 to 17 inches; very fine sandy loam
Bt4—17 to 24 inches; very fine sandy loam
2Bt5—24 to 32 inches; very gravelly very fine sandy loam
2Cr/Bt—32 to 53 inches; very gravelly sandy clay loam
2Cr1—53 to 65 inches; bedrock
2Cr2—65 inches; bedrock

Minor Components in Map Unit 638

Soils that are less than 40 inches deep to bedrock
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

639—Ultic Haploxeralfs, sandstone, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 950 to 1,715 feet (290 to 524 meters)
Mean annual precipitation: 47 to 50 inches (1,194 to 1,270 millimeters)
Mean annual air temperature: 57 degrees F (14 degrees C)
Frost-free period: 235 to 240 days

Map Unit Composition

Ultic Haploxeralfs, sandstone—75 percent
Minor components—25 percent

Characteristics of Ultic Haploxeralfs, Sandstone

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Sandy colluvium and/or residuum weathered from marine sandstone
Observed vegetation: Canyon live oak, blue oak, California black oak, foothill pine, manzanita, deerbrush, California laurel, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; very fine sandy loam
Bt1—2 to 6 inches; very fine sandy loam
Bt2—6 to 11 inches; very fine sandy loam
Bt3—11 to 17 inches; very fine sandy loam
Bt4—17 to 24 inches; very fine sandy loam
2Bt5—24 to 32 inches; very gravelly very fine sandy loam
2Cr/Bt—32 to 53 inches; very gravelly sandy clay loam
2Cr1—53 to 65 inches; bedrock
2Cr2—65 inches; bedrock

Minor Components in Map Unit 639

Chinacamp and similar soils
Composition: 13 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to bedrock
Composition: 10 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

640—Ultic Haploxeralfs, sandstone, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 715 to 1,800 feet (219 to 549 meters)
Mean annual precipitation: 35 to 58 inches (889 to 1,473 millimeters)
Mean annual air temperature: 55 to 59 degrees F (13 to 15 degrees C)
Frost-free period: 220 to 250 days

Map Unit Composition

Ultic Haploxeralfs, sandstone—75 percent
Minor components—25 percent

Characteristics of Ultic Haploxeralfs, Sandstone

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Sandy colluvium and/or residuum weathered from marine sandstone
Observed vegetation: Canyon live oak, Douglas-fir, ponderosa pine, California black oak, foothill pine, manzanita, deerbrush, California laurel, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; very fine sandy loam

Bt1—2 to 6 inches; very fine sandy loam
Bt2—6 to 11 inches; very fine sandy loam
Bt3—11 to 17 inches; very fine sandy loam
Bt4—17 to 24 inches; very fine sandy loam
2Bt5—24 to 32 inches; very gravelly very fine sandy loam
2Cr/Bt—32 to 53 inches; very gravelly sandy clay loam
2Cr1—53 to 65 inches; bedrock
2Cr2—65 inches; bedrock

Minor Components in Map Unit 640

Rock outcrop
Composition: 10 percent
Slope: 50 to 175 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Coalcanyon taxadjunct and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

641—Ultic Haploxeralfs, sandstone, 70 to 100 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Areas of marine sandstone exposed in Southern Cascade foothills
Elevation: 600 to 1,800 feet (183 to 549 meters)
Mean annual precipitation: 50 to 58 inches (1,270 to 1,473 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 220 to 235 days

Map Unit Composition

Ultic Haploxeralfs, sandstone—75 percent
Minor components—25 percent

Characteristics of Ultic Haploxeralfs, Sandstone

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons

Parent material: Sandy colluvium and/or residuum weathered from marine sandstone
Observed vegetation: Canyon live oak, Douglas-fir, ponderosa pine, California black oak, foothill pine, manzanita, deerbrush, California laurel, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subangular gravel, 0 to 5 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; very fine sandy loam
Bt1—2 to 6 inches; very fine sandy loam
Bt2—6 to 11 inches; very fine sandy loam
Bt3—11 to 17 inches; very fine sandy loam
Bt4—17 to 24 inches; very fine sandy loam
2Bt5—24 to 32 inches; very gravelly very fine sandy loam
2Cr/Bt—32 to 53 inches; very gravelly sandy clay loam
2Cr1—53 to 65 inches; bedrock
2Cr2—65 inches; bedrock

Minor Components in Map Unit 641

Rock outcrop
Composition: 10 percent
Slope: 70 to 175 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Coalcanyon taxadjunct and similar soils
Composition: 5 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to bedrock
Composition: 5 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

642—Chinacamp gravelly loam, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 340 to 1,100 feet (104 to 336 meters)
Mean annual precipitation: 29 to 50 inches (737 to 1,270 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 230 to 255 days

Map Unit Composition

Chinacamp gravelly loam—70 percent
Minor components—30 percent

Characteristics of Chinacamp Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Toeslopes in canyons
Parent material: Stony, fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Canyon live oak, California black oak, blue oak, manzanita, bigleaf maple, California laurel, deerbrush, Pacific poison oak, foothill pine, valley oak, ponderosa pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent medium gravel, 0 to 20 percent cobbles, 0 to 30 percent stones, 0 to 15 percent boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A—1 to 5 inches; gravelly loam
- Bt1—5 to 15 inches; gravelly clay loam
- Bt2—15 to 29 inches; gravelly clay loam

Bt3—29 to 38 inches; gravelly clay loam
Bt4—38 to 44 inches; gravelly clay loam
Bt5—44 to 61 inches; extremely stony clay loam
Bt6—61 to 72 inches; very stony clay loam

Minor Components in Map Unit 642

Clayey-skeletal soils
Composition: 6 percent
Slope: 3 to 15 percent
Geomorphic position: Toeslopes in canyons
Hydric soil status: Not hydric

Durixeralfs and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Terrace remnants on toeslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Toeslopes in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Toeslopes in canyons
Hydric soil status: Not hydric

Slideland and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Toeslopes in canyons
Hydric soil status: Not hydric

Soils that have more than 10 percent boulders in the subsoil
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Areas along drainageways on toeslopes in canyons
Hydric soil status: Not hydric

Soils that have more than 30 percent stones in the subsoil
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Areas along drainageways on toeslopes in canyons
Hydric soil status: Not hydric

643—Chinacamp gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 295 to 1,800 feet (91 to 549 meters)

Mean annual precipitation: 30 to 57 inches (762 to 1,448 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 215 to 255 days

Map Unit Composition

Chinacamp gravelly loam—70 percent
Minor components—30 percent

Characteristics of Chinacamp Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Footslopes in canyons
Parent material: Stony, fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Canyon live oak, California black oak, blue oak, manzanita, bigleaf maple, California laurel, deerbrush, Pacific poison oak, foothill pine, valley oak, ponderosa pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent medium gravel, 0 to 20 percent cobbles, 0 to 30 percent stones, 0 to 15 percent boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; gravelly loam
Bt1—5 to 15 inches; gravelly clay loam
Bt2—15 to 29 inches; gravelly clay loam
Bt3—29 to 38 inches; gravelly clay loam
Bt4—38 to 44 inches; gravelly clay loam
Bt5—44 to 61 inches; extremely stony clay loam
Bt6—61 to 72 inches; very stony clay loam

Minor Components in Map Unit 643

Clayey-skeletal soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 6 percent
Slope: 15 to 30 percent

Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Durixeralfs and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Terrace remnants on footslopes in canyons
Hydric soil status: Not hydric

Slideland and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Soils that have more than 10 percent boulders in the subsoil
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Areas along drainageways on footslopes in canyons
Hydric soil status: Not hydric

Soils that have more than 30 percent stones in the subsoil
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Areas along drainageways on footslopes in canyons
Hydric soil status: Not hydric

644—Chinacamp gravelly loam, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 415 to 2,000 feet (128 to 610 meters)
Mean annual precipitation: 30 to 57 inches (762 to 1,448 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 215 to 260 days

Map Unit Composition

Chinacamp gravelly loam—70 percent
Minor components—30 percent

Characteristics of Chinacamp Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Parent material: Stony, fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Canyon live oak, California black oak, blue oak, manzanita, bigleaf maple, California laurel, deerbrush, Pacific poison oak, foothill pine, valley oak, ponderosa pine, and annual grasses and forbs

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent medium gravel, 0 to 20 percent cobbles, 0 to 30 percent stones, 0 to 15 percent boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; gravelly loam
Bt1—5 to 15 inches; gravelly clay loam
Bt2—15 to 29 inches; gravelly clay loam
Bt3—29 to 38 inches; gravelly clay loam
Bt4—38 to 44 inches; gravelly clay loam
Bt5—44 to 61 inches; extremely stony clay loam
Bt6—61 to 72 inches; very stony clay loam

Minor Components in Map Unit 644

Clayey-skeletal soils
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 6 percent
Slope: 30 to 50 percent

Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

645—Chinacamp gravelly loam, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 400 to 1,600 feet (122 to 488 meters)
Mean annual precipitation: 30 to 50 inches (762 to 1,270 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Chinacamp gravelly loam—70 percent
Minor components—30 percent

Characteristics of Chinacamp Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Stony, fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Canyon live oak, California black oak, blue oak, manzanita, bigleaf maple, California laurel, deerbrush, Pacific poison oak, foothill pine, valley oak, ponderosa pine, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent medium gravel, 0 to 20 percent cobbles, 0 to 30 percent stones, 0 to 15 percent boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 5 inches; gravelly loam
Bt1—5 to 15 inches; gravelly clay loam
Bt2—15 to 29 inches; gravelly clay loam
Bt3—29 to 38 inches; gravelly clay loam
Bt4—38 to 44 inches; gravelly clay loam
Bt5—44 to 61 inches; extremely stony clay loam
Bt6—61 to 72 inches; very stony clay loam

Minor Components in Map Unit 645

Rock outcrop
Composition: 8 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs gravelly loam and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

646—Coalcanyon taxadjunct very gravelly loam, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 600 to 1,115 feet (183 to 341 meters)
Mean annual precipitation: 30 to 37 inches (762 to 940 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 255 to 260 days

Map Unit Composition

Coalcanyon Taxadjunct very gravelly loam—80 percent
Minor components—20 percent

Characteristics of Coalcanyon Taxadjunct Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Blue oak, interior live oak, canyon live oak, foothill pine, California laurel, Pacific poison oak, manzanita, deerbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent subangular gravel, 5 to 50 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 20 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4s-7
Land capability, nonirrigated: 4s-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very gravelly loam
Bt2—6 to 14 inches; very gravelly clay loam
Bt3—14 to 24 inches; very gravelly clay loam
Bt4—24 to 42 inches; extremely cobbly clay loam
2Bt5—42 to 54 inches; very cobbly clay
2Bt6—54 to 72 inches; very gravelly clay loam

Minor Components in Map Unit 646

Clayey-skeletal soils
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Benches in canyons
Hydric soil status: Not hydric

647—Coalcanyon taxadjunct very gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 635 to 1,275 feet (195 to 390 meters)
Mean annual precipitation: 30 to 47 inches (762 to 1,194 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Coalcanyon Taxadjunct very gravelly loam—75 percent
Minor components—25 percent

Characteristics of Coalcanyon Taxadjunct Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Blue oak, interior live oak, canyon live oak, foothill pine, California laurel, Pacific poison oak, manzanita, deerbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent subangular gravel, 5 to 50 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 20 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 4s-7
- *Land capability, nonirrigated:* 4s-7
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 2 inches; very gravelly loam
- Bt1—2 to 6 inches; very gravelly loam
- Bt2—6 to 14 inches; very gravelly clay loam
- Bt3—14 to 24 inches; very gravelly clay loam
- Bt4—24 to 42 inches; extremely cobbly clay loam
- 2Bt5—42 to 54 inches; very cobbly clay
- 2Bt6—54 to 72 inches; very gravelly clay loam

Minor Components in Map Unit 647

Clayey-skeletal soils
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

648—Coalcanyon taxadjunct very gravelly loam, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 435 to 1,555 feet (134 to 475 meters)
Mean annual precipitation: 30 to 47 inches (762 to 1,194 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Coalcanyon Taxadjunct very gravelly loam—80 percent
Minor components—20 percent

Characteristics of Coalcanyon Taxadjunct Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Blue oak, interior live oak, canyon live oak, foothill pine, California laurel, Pacific poison oak, manzanita, deerbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent subangular

gravel, 5 to 50 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 20 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-7
Land capability, nonirrigated: 6e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very gravelly loam
Bt2—6 to 14 inches; very gravelly clay loam
Bt3—14 to 24 inches; very gravelly clay loam
Bt4—24 to 42 inches; extremely cobbly clay loam
2Bt5—42 to 54 inches; very cobbly clay
2Bt6—54 to 72 inches; very gravelly clay loam

Minor Components in Map Unit 648

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 8 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

649—Coalcanyon taxadjunct very gravelly loam, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 675 to 1,915 feet (207 to 585 meters)
Mean annual precipitation: 35 to 47 inches (889 to 1,194 millimeters)
Mean annual air temperature: 57 to 59 degrees F (14 to 15 degrees C)
Frost-free period: 240 to 255 days

Map Unit Composition

Coalcanyon Taxadjunct very gravelly loam—75 percent
Minor components—25 percent

Characteristics of Coalcanyon Taxadjunct Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Stony and gravelly colluvium derived from basalt
Observed vegetation: Blue oak, interior live oak, canyon live oak, foothill pine, California laurel, Pacific poison oak, manzanita, deerbrush, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent subangular stones, 0 to 20 percent subangular boulders, 10 to 60 percent subangular gravel, 5 to 50 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 7e-7
- *Land capability, nonirrigated:* 7e-7
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 2 inches; very gravelly loam
- Bt1—2 to 6 inches; very gravelly loam
- Bt2—6 to 14 inches; very gravelly clay loam
- Bt3—14 to 24 inches; very gravelly clay loam
- Bt4—24 to 42 inches; extremely cobbly clay loam
- 2Bt5—42 to 54 inches; very cobbly clay
- 2Bt6—54 to 72 inches; very gravelly clay loam

Minor Components in Map Unit 649

Ultic Haploxeralfs, sandstone, and similar soils
Composition: 10 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Chinacamp and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Coonhollow gravelly loam and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

650—Schott very gravelly loam, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, timber production, watershed, and wildlife habitat
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,400 to 3,595 feet (427 to 1,097 meters)
Mean annual precipitation: 40 to 72 inches (1,016 to 1,829 millimeters)
Mean annual air temperature: 52 to 57 degrees F (11 to 14 degrees C)
Frost-free period: 155 to 230 days

Map Unit Composition

Schott very gravelly loam—65 percent
Minor components—35 percent

Characteristics of Schott Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, California black oak, canyon live oak, manzanita, California buckthorn, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 13 inches; very gravelly clay loam
Bt2—13 to 22 inches; very cobbly clay loam
Bt3—22 to 40 inches; extremely gravelly clay loam
Bt4—40 to 50 inches; extremely gravelly sandy clay loam
R—50 inches; bedrock

Minor Components in Map Unit 650

Lydon soils, 20 to 35 percent clay, and similar soils
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 8 percent
Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Andic Haploxeralfs with paralithic bedrock at a depth of 20 to 60 inches and similar soils
Composition: 7 percent
Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Rockstripe and similar soils
Composition: 2 percent
Slope: 3 to 15 percent

Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

651—Schott very gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,400 to 3,595 feet (427 to 1,097 meters)
Mean annual precipitation: 40 to 72 inches (1,016 to 1,829 millimeters)
Mean annual air temperature: 52 to 57 degrees F (11 to 14 degrees C)
Frost-free period: 155 to 230 days

Map Unit Composition

Schott very gravelly loam—65 percent
Minor components—35 percent

Characteristics of Schott Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Loamy colluvium and/or residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, California black oak, canyon live oak, manzanita, California buckthorn, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 6 inches; very gravelly loam
- Bt1—6 to 13 inches; very gravelly clay loam
- Bt2—13 to 22 inches; very cobbly clay loam
- Bt3—22 to 40 inches; extremely gravelly clay loam
- Bt4—40 to 50 inches; extremely gravelly sandy clay loam
- R—50 inches; bedrock

Minor Components in Map Unit 651

Lydon and similar soils
Composition: 9 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Lydon soils, 20 to 35 percent clay, and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Andic Haploxeralfs with paralithic bedrock at a depth of 20 to 60 inches and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Rockstripe and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

652—Schott-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,400 to 3,595 feet (427 to 1,097 meters)
Mean annual precipitation: 40 to 72 inches (1,016 to 1,829 millimeters)
Mean annual air temperature: 52 to 57 degrees F (11 to 14 degrees C)
Frost-free period: 155 to 230 days

Map Unit Composition

Schott very gravelly loam—65 percent
Rock outcrop (mudflow breccia)—20 percent
Minor components—15 percent

Characteristics of Schott Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Loamy residuum and/or colluvium derived from volcanic breccia
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, California black oak, canyon live oak, manzanita, California buckthorn, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 13 inches; very gravelly clay loam
Bt2—13 to 22 inches; very cobbly clay loam
Bt3—22 to 40 inches; extremely gravelly clay loam
Bt4—40 to 50 inches; extremely gravelly sandy clay loam
R—50 inches; bedrock

Characteristics of Rock Outcrop (Mudflow Breccia)

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 652

Lydon soils, 20 to 35 percent clay, and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Andic Haploxeralfs with paralithic bedrock at a depth of 20 to 60 inches and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Tusccoll and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Rockstripe and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

654—Coridge-Rock outcrop complex, 3 to 8 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 340 to 1,755 feet (104 to 536 meters)
Mean annual precipitation: 26 to 37 inches (660 to 940 millimeters)
Mean annual air temperature: 59 to 61 degrees F (15 to 16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coridge bouldery loam—70 percent
Rock outcrop (Cohasset basalt)—20 percent
Minor components—10 percent

Characteristics of Coridge Bouldery Loam

Slope: 3 to 8 percent
Geomorphic position: The top of basalt ridges
Parent material: Fine-loamy residuum over clayey residuum weathered from basalt
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, buckbrush, chamise, scrub oak, manzanita, and Pacific poison oak
Texture of the surface layer: Bouldery loam
Percentage of the surface covered by rock fragments: 5 to 25 percent medium gravel, 5 to 15 percent cobbles, 5 to 15 percent stones, 2 to 20 percent boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 10 to 40 inches
Available water capacity: Low (about 3.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-7
Land capability, nonirrigated: 7e-7
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 1 inch; bouldery loam
Bt1—1 to 6 inches; gravelly loam
Bt2—6 to 12 inches; gravelly clay loam
Bt3—12 to 19 inches; very gravelly clay loam
Bt4—19 to 24 inches; very gravelly clay
R—24 inches; bedrock

Characteristics of Rock Outcrop (Cohasset Basalt)

Slope: 3 to 8 percent
Geomorphic position: The top of basalt ridges
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 654

Soils that are less than 20 inches deep to bedrock
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to bedrock
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

655—Coridge-Rock outcrop complex, 8 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 380 to 1,095 feet (116 to 335 meters)
Mean annual precipitation: 27 to 29 inches (686 to 737 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Coridge bouldery loam—70 percent
Rock outcrop (Cohasset basalt)—20 percent
Minor components—10 percent

Characteristics of Coridge Bouldery Loam

Slope: 8 to 15 percent
Geomorphic position: The top of basalt ridges
Parent material: Fine-loamy residuum over clayey residuum weathered from basalt
Observed vegetation: Annual grasses and forbs, blue oak, foothill pine, buckbrush, chamise, scrub oak, manzanita, and Pacific poison oak
Texture of the surface layer: Bouldery loam
Percentage of the surface covered by rock fragments: 5 to 25 percent medium gravel, 5 to 15 percent cobbles, 5 to 15 percent stones, 2 to 20 percent boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 10 to 40 inches
- *Available water capacity:* Low (about 3.0 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7e-7
- *Land capability, nonirrigated:* 7e-7
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 1 inch; bouldery loam
- Bt1—1 to 6 inches; gravelly loam
- Bt2—6 to 12 inches; gravelly clay loam
- Bt3—12 to 19 inches; very gravelly clay loam
- Bt4—19 to 24 inches; very gravelly clay
- R—24 inches; bedrock

Characteristics of Rock Outcrop (Cohasset Basalt)

Slope: 8 to 15 percent
Geomorphic position: The top of basalt ridges
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 655

Soils that are less than 20 inches deep to bedrock
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to bedrock
Composition: 5 percent
Slope: 8 to 15 percent

Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

656—Rock outcrop, cliffs-Coalcanyon taxadjunct complex, 15 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 295 to 2,200 feet (91 to 671 meters)
Mean annual precipitation: 27 to 53 inches (686 to 1,346 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Rock outcrop (basalt cliffs)—40 percent
Coalcanyon Taxadjunct very gravelly loam—40 percent
Minor components—20 percent

Characteristics of Rock Outcrop (Basalt Cliffs)

Slope: 15 to 200 percent
Geomorphic position: Basalt escarpments in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Coalcanyon Taxadjunct Very Gravelly Loam

Slope: 15 to 50 percent
Geomorphic position: Basalt escarpments in canyons
Parent material: Bouldery and gravelly colluvium derived from basalt
Observed vegetation: Interior live oak, canyon live oak, California laurel, Pacific poison oak, toyon, blue oak, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 60 percent subangular gravel, 5 to 50 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 20 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 6e-7
- *Land capability, nonirrigated:* 6e-7
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
A—0 to 2 inches; very gravelly loam
Bt1—2 to 6 inches; very gravelly loam
Bt2—6 to 14 inches; very gravelly clay loam
Bt3—14 to 24 inches; very gravelly clay loam
Bt4—24 to 42 inches; extremely cobbly clay loam
2Bt5—42 to 54 inches; very cobbly clay
2Bt6—54 to 72 inches; very gravelly clay loam

Minor Components in Map Unit 656

Coonhollow gravelly loam and similar soils
Composition: 10 percent
Slope: 15 to 50 percent
Geomorphic position: Basalt escarpments in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 5 percent
Slope: 15 to 50 percent
Geomorphic position: Basalt escarpments in canyons
Hydric soil status: Not hydric

Talus
Composition: 5 percent
Slope: 15 to 50 percent
Geomorphic position: Basalt escarpments in canyons
Hydric soil status: Not hydric

657—Bonneyridge-Chawanakee-Rock outcrop complex, 2 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,600 feet (1,097 to 1,707 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 80 to 170 days

Map Unit Composition

Bonneyridge sandy loam—35 percent
Chawanakee gravelly sandy loam—30 percent
Rock outcrop (quartz diorite)—20 percent
Minor components—15 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, white fir, sugar pine, incense cedar, California

black oak, tanoak, whitethorn ceanothus, Sierra chinquapin, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite
Observed vegetation: Manzanita, ponderosa pine, sugar pine, white fir, canyon live oak, tanoak, incense cedar, shrub tanoak, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1

Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Characteristics of Rock Outcrop (Quartz Diorite)

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 657

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Dystric Xeropsamments and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Lithic Xeropsamments and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Billscabin gravelly sandy loam and similar soils
Composition: 1 percent

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

658—Bonneyridge-Chawanakee-Rock outcrop complex, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,780 feet (1,097 to 1,762 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 80 to 170 days

Map Unit Composition

Bonneyridge sandy loam—35 percent
Chawanakee gravelly sandy loam—30 percent
Rock outcrop (quartz diorite)—25 percent
Minor components—10 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from quartz diorite
Observed vegetation: Ponderosa pine, white fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, Sierra chinquapin, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam

A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite
Observed vegetation: Manzanita, ponderosa pine, sugar pine, white fir, canyon live oak, tanoak, incense cedar, shrub tanoak, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches

659—Bonneyridge-Chawanakee-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,795 to 5,600 feet (853 to 1,707 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 80 to 170 days

Map Unit Composition

Bonneyridge sandy loam—35 percent
Chawanakee gravelly sandy loam—30 percent
Rock outcrop (quartz diorite)—25 percent
Minor components—10 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from quartz diorite

Observed vegetation: Ponderosa pine, white fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, Sierra chinquapin, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups

660—Bonneyridge-Chawanakee-Rock outcrop complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,495 to 4,900 feet (762 to 1,494 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 80 to 170 days

Map Unit Composition

Bonneyridge sandy loam—30 percent
Chawanakee gravelly sandy loam—30 percent
Rock outcrop (quartz diorite)—30 percent
Minor components—10 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from quartz diorite
Observed vegetation: Ponderosa pine, white fir, sugar pine, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, Sierra chinquapin, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8

661—Millerridge-Boxrobber complex, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,400 to 2,850 feet (427 to 869 meters)
Mean annual precipitation: 45 to 55 inches (1,143 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Millerridge gravelly sandy clay loam—45 percent
Boxrobber cobbly sandy clay loam—40 percent
Minor components—15 percent

Characteristics of Millerridge Gravelly Sandy Clay Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from ultramafic rocks
Observed vegetation: Blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly sandy clay loam

Percentage of the surface covered by rock fragments: 0 to 60 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-9
Land capability, nonirrigated: 3e-9
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly sandy clay loam
Bt1—2 to 6 inches; stony sandy clay loam
Bt2—6 to 12 inches; cobbly clay loam
Bt3—12 to 20 inches; cobbly clay loam
Bt4—20 to 26 inches; gravelly clay
Crt—26 inches; bedrock

Characteristics of Boxrobber Cobbly Sandy Clay Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic mountains
Parent material: Gravelly and loamy residuum weathered from ultramafic rocks
Observed vegetation: Blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Cobbly sandy clay loam
Percentage of the surface covered by rock fragments: 5 to 60 percent medium gravel, 5 to 30 percent cobbles, 5 to 20 percent stones, 3 to 15 percent boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 79 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-7
Land capability, nonirrigated: 7e-7
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; cobbly sandy clay loam

Bt1—2 to 8 inches; very gravelly sandy clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Crt—16 to 30 inches; bedrock
R—30 inches; bedrock

Minor Components in Map Unit 661

Earlal and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic mountains

Griffgulch and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

At an elevation of less than 1,800 feet, soils with a thermic soil temperature regime
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

662—Millerridge-Boxrobber complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, watershed, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,400 to 2,700 feet (427 to 823 meters)
Mean annual precipitation: 45 to 55 inches (1,143 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Millerridge gravelly sandy clay loam—45 percent
Boxrobber cobbly sandy clay loam—40 percent
Minor components—15 percent

Characteristics of Millerridge Gravelly Sandy Clay Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Parent material: Fine-loamy colluvium derived from ultramafic rocks
Observed vegetation: Blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly sandy clay loam
Percentage of the surface covered by rock fragments: 0 to 60 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-9
Land capability, nonirrigated: 4e-9
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly sandy clay loam
Bt1—2 to 6 inches; stony sandy clay loam
Bt2—6 to 12 inches; cobbly clay loam
Bt3—12 to 20 inches; cobbly clay loam
Bt4—20 to 26 inches; gravelly clay
Crt—26 inches; bedrock

Characteristics of Boxrobber Cobbly Sandy Clay Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Parent material: Gravelly and loamy colluvium derived from ultramafic rocks
Observed vegetation: Blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Cobbly sandy clay loam
Percentage of the surface covered by rock fragments: 5 to 60 percent medium gravel, 5 to 30 percent cobbles, 5 to 20 percent stones, 3 to 15 percent boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 79 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-7
Land capability, nonirrigated: 7e-7
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; cobbly sandy clay loam
Bt1—2 to 8 inches; very gravelly sandy clay loam
Bt2—8 to 16 inches; very gravelly clay loam
Crt—16 to 30 inches; bedrock
R—30 inches; bedrock

Minor Components in Map Unit 662

Earlal and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Hydric soil status: Not hydric

Typic Haploxeralfs, magnesic, and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

At an elevation of less than 1,800 feet, soils with a thermic soil temperature regime
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

663—Millerridge-Boxrobber complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 950 to 2,795 feet (290 to 853 meters)
Mean annual precipitation: 47 to 55 inches (1,194 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Millerridge gravelly sandy clay loam—45 percent
Boxrobber cobbly sandy clay loam—40 percent
Minor components—15 percent

Characteristics of Millerridge Gravelly Sandy Clay Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Fine-loamy colluvium derived from ultramafic rocks
Observed vegetation: Canyon live oak, blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly sandy clay loam
Percentage of the surface covered by rock fragments: 0 to 60 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6e-9
- *Land capability, nonirrigated:* 6e-9
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* C

Typical profile
- A—0 to 2 inches; gravelly sandy clay loam
- Bt1—2 to 6 inches; stony sandy clay loam
- Bt2—6 to 12 inches; cobbly clay loam
- Bt3—12 to 20 inches; cobbly clay loam
- Bt4—20 to 26 inches; gravelly clay
- Crt—26 inches; bedrock

Characteristics of Boxrobber Cobbly Sandy Clay Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Gravelly and loamy colluvium derived from ultramafic rocks
Observed vegetation: Canyon live oak, blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Cobbly sandy clay loam
Percentage of the surface covered by rock fragments: 5 to 60 percent medium gravel, 5 to 30 percent cobbles, 5 to 20 percent stones, 3 to 15 percent boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 79 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 1.3 inches)
- *Natural drainage class:* Well drained

Surnuf and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

664—Millerridge-Boxrobber complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 950 to 2,595 feet (290 to 792 meters)
Mean annual precipitation: 47 to 55 inches (1,194 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 240 days

Map Unit Composition

Millerridge gravelly sandy clay loam—45 percent
Boxrobber cobbly sandy clay loam—40 percent
Minor components—15 percent

Characteristics of Millerridge Gravelly Sandy Clay Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on ultramafic mountains
Parent material: Fine-loamy colluvium derived from ultramafic rocks
Observed vegetation: Canyon live oak, blue oak, foothill pine, California laurel, manzanita, buckbrush, and annual grasses and forbs
Texture of the surface layer: Gravelly sandy clay loam
Percentage of the surface covered by rock fragments: 0 to 60 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic mountains
Hydric soil status: Not hydric

665—Surnuf-Bigridge complex, 3 to 15 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,440 to 2,295 feet (439 to 701 meters)
Mean annual precipitation: 46 to 55 inches (1,168 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 235 to 245 days

Map Unit Composition

Surnuf gravelly loam—40 percent
Bigridge loam—40 percent
Minor components—20 percent

Characteristics of Surnuf Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metasedimentary mountains
Parent material: Silty and clayey residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, canyon live oak, California black oak, incense cedar, tanoak, Pacific madrone, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Bigridge Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metasedimentary mountains
Parent material: Fine-loamy residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, canyon live oak, California black oak, incense cedar, tanoak, Pacific madrone, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Minor Components in Map Unit 665

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metasedimentary mountains
Hydric soil status: Not hydric

668—Surnuf-Bigridge complex, 50 to 70 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 2,715 feet (274 to 829 meters)

Mean annual precipitation: 46 to 60 inches (1,168 to 1,524 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 200 to 245 days

Map Unit Composition

Surnuf gravelly loam—40 percent
Bigridge loam—40 percent
Minor components—20 percent

Characteristics of Surnuf Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Silty and clayey residuum and/or colluvium derived from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, canyon live oak, California black oak, incense cedar, tanoak, Pacific madrone, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Bigridge Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, canyon live oak, California black oak, incense cedar, tanoak, Pacific madrone, manzanita, toyon, and Pacific poison oak

Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Minor Components in Map Unit 668

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 10 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Spine taxadjunct and similar soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

669—Oroshore-Mounthope-Dunstone complex, 3 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Homesite development, livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 435 to 2,095 feet (134 to 640 meters)
Mean annual precipitation: 35 to 50 inches (889 to 1,270 millimeters)
Mean annual air temperature: 57 to 61 degrees F (14 to 16 degrees C)
Frost-free period: 240 to 260 days

Map Unit Composition

Oroshore gravelly loam—35 percent
Mounthope loam—25 percent
Dunstone gravelly loam—20 percent
Minor components—20 percent

Characteristics of Oroshore Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Parent material: Gravelly and loamy residuum weathered from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent angular gravel, 0 to 25 percent angular cobbles, 0 to 10 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.1 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- A—0 to 2 inches; gravelly loam
- Bt1—2 to 15 inches; gravelly clay loam
- Bt2—15 to 28 inches; very cobbly clay loam
- Bt3—28 to 34 inches; extremely gravelly clay loam
- Crt—34 inches; bedrock

Characteristics of Mounthope Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Parent material: Fine-loamy residuum weathered from metamorphic rocks
Observed vegetation: Interior live oak, canyon live oak, foothill pine, blue oak, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Dunstone Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Parent material: Loamy residuum weathered from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Minor Components in Map Unit 669

Rock outcrop
Composition: 6 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Hydric soil status: Not hydric

Fine textured soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on ultramafic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metamorphic hills
Hydric soil status: Not hydric

670—Oroshore-Mounthope-Dunstone complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Homesite development, livestock grazing, wildlife habitat, and watershed
Major land resource area: 18

Landscape: Northern Sierra Nevada foothills
Elevation: 435 to 2,095 feet (134 to 640 meters)
Mean annual precipitation: 35 to 60 inches (889 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 200 to 260 days

Map Unit Composition

Oroshore gravelly loam—35 percent
Mounthope loam—25 percent
Dunstone gravelly loam—20 percent
Minor components—20 percent

Characteristics of Oroshore Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent angular gravel, 0 to 25 percent angular cobbles, 0 to 10 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 15 inches; gravelly clay loam
Bt2—15 to 28 inches; very cobbly clay loam
Bt3—28 to 34 inches; extremely gravelly clay loam
Crt—34 inches; bedrock

Characteristics of Mounthope Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Parent material: Fine-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Interior live oak, canyon live oak, foothill pine, blue oak, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse,

subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Dunstone Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Parent material: Loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Minor Components in Map Unit 670

Rock outcrop
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Hydric soil status: Not hydric

Fine textured soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic hills
Hydric soil status: Not hydric

671—Oroshore-Mounthope-Dunstone complex, 30 to 50 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 590 to 2,400 feet (180 to 732 meters)
Mean annual precipitation: 35 to 60 inches (889 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 200 to 260 days

Map Unit Composition

Oroshore gravelly loam—35 percent
Mounthope loam—25 percent

Dunstone gravelly loam—20 percent
Minor components—20 percent

Characteristics of Oroshore Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent angular gravel, 0 to 25 percent angular cobbles, 0 to 10 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 15 inches; gravelly clay loam
Bt2—15 to 28 inches; very cobbly clay loam
Bt3—28 to 34 inches; extremely gravelly clay loam
Crt—34 inches; bedrock

Characteristics of Mounthope Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Parent material: Fine-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Interior live oak, canyon live oak, foothill pine, blue oak, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Dunstone Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Parent material: Loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Minor Components in Map Unit 671

Rock outcrop
Composition: 10 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Hydric soil status: Not hydric

Fine textured soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic hills
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic hills
Hydric soil status: Not hydric

672—Oroshore-Mounthope-Dunstone complex, 50 to 70 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 895 to 2,400 feet (274 to 732 meters)
Mean annual precipitation: 37 to 60 inches (940 to 1,524 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 200 to 260 days

Map Unit Composition

Oroshore gravelly loam—30 percent
Mounthope loam—25 percent
Dunstone gravelly loam—25 percent
Minor components—20 percent

Characteristics of Oroshore Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons

Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 30 percent angular gravel, 0 to 25 percent angular cobbles, 0 to 10 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 15 inches; gravelly clay loam
Bt2—15 to 28 inches; very cobbly clay loam
Bt3—28 to 34 inches; extremely gravelly clay loam
Crt—34 inches; bedrock

Characteristics of Mounthope Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Interior live oak, canyon live oak, foothill pine, blue oak, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; loam
Bt1—3 to 7 inches; loam
Bt2—7 to 15 inches; loam
Bt3—15 to 22 inches; gravelly clay loam
Bt4—22 to 26 inches; gravelly clay loam
Bt5—26 to 31 inches; very gravelly clay loam
Bt6—31 to 42 inches; very gravelly clay loam
Bt7—42 to 52 inches; gravelly clay loam
Cr—52 inches; bedrock

Characteristics of Dunstone Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Annual grasses and forbs, blue oak, interior live oak, canyon live oak, foothill pine, buckbrush, manzanita, toyon, and Pacific poison oak
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 5 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 1 percent subangular boulders
Depth to a restrictive feature: 10 to 20 inches to paralithic bedrock; 20 to 40 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1

Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 4 inches; gravelly loam
A2—4 to 6 inches; gravelly loam
Bt1—6 to 10 inches; gravelly loam
Bt2—10 to 15 inches; very gravelly loam
Crt—15 to 37 inches; bedrock
R—37 inches; bedrock

Minor Components in Map Unit 672

Rock outcrop
Composition: 12 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Fine textured soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

674—Chawanakee-Bonneyridge-Rock outcrop complex, 70 to 110 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,675 to 3,995 feet (512 to 1,219 meters)
Mean annual precipitation: 72 to 78 inches (1,829 to 1,981 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 100 to 150 days

Map Unit Composition

Chawanakee gravelly sandy loam—30 percent
Bonneyridge sandy loam—30 percent
Rock outcrop (quartz diorite)—30 percent
Minor components—10 percent

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Manzanita, ponderosa pine, sugar pine, white fir, canyon live oak, tanoak, incense cedar, shrub tanoak, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders

Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Characteristics of Bonneyridge Sandy Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Coarse-loamy colluvium derived from quartz diorite
Observed vegetation: Ponderosa pine, white fir, sugar pine, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, Sierra chinquapin, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam

Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Rock Outcrop (Quartz Diorite)

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 674

Lithic Xerorthents and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Lithic Xeropsamments and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 1 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Billscabin gravelly sandy loam and similar soils
Composition: 1 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

675—Clearhayes-Hamslough complex, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 400 feet (43 to 122 meters)
Mean annual precipitation: 25 to 29 inches (635 to 737 millimeters)

Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Clearhayes sandy clay loam—70 percent
Hamslough clay—15 percent
Minor components—15 percent

Characteristics of Clearhayes Sandy Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Bars on low strath terraces
Parent material: Fine-loamy alluvium derived from volcanic rocks over gravelly alluvium derived from andesite
Observed vegetation: Annual grasses and forbs, with blue oak, interior live oak, and buckeye at the higher elevations
Texture of the surface layer: Sandy clay loam
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, rounded gravel, 0 to 5 percent rounded cobbles, 0 to 2 percent rounded stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 13 to 60 inches
Available water capacity: Low (about 3.0 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 55 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; sandy clay loam
Bt1—2 to 10 inches; gravelly sandy clay loam
Bt2—10 to 19 inches; gravelly sandy clay loam
C1—19 to 28 inches; extremely gravelly sandy loam
C2—28 to 38 inches; extremely gravelly loamy coarse sand
C3—38 to 46 inches; extremely gravelly sandy clay loam
2Cr—46 inches; bedrock

Characteristics of Hamslough Clay

Slope: 0 to 2 percent
Geomorphic position: Channels on low strath terraces
Parent material: Clayey alluvium over gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 20 percent medium, rounded gravel, 0 to 25 percent rounded cobbles
Depth to a restrictive feature: 20 to 40 inches to a duripan; 44 to 88 inches to paralithic bedrock
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 80 inches
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Storie index: 15 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay
A2—3 to 14 inches; cobbly clay
Bw—14 to 19 inches; extremely gravelly clay
Bg—19 to 27 inches; extremely gravelly sandy clay
2Bqm—27 inches; duripan

Minor Components in Map Unit 675

Soils that are less than 40 inches deep to bedrock
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on low strath terraces
Hydric soil status: Not hydric

Redsluff taxadjunct and similar soils
Composition: 3 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Soils that are frequently flooded
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Flood plains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Anita soils with a gravelly duripan and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Clayey swales on strath terraces
Hydric soil status: Hydric

Typic Haploxeralfs, very stony, and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces in canyons
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Channels and vernal pools on low strath terraces
Hydric soil status: Hydric

676—Carhart-Anita taxadjunct complex, 0 to 12 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 495 feet (44 to 152 meters)
Mean annual precipitation: 25 to 30 inches (635 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Carhart clay—50 percent
Anita taxadjunct clay—40 percent
Minor components—10 percent

Characteristics of Carhart Clay

Slope: 0 to 12 percent
Geomorphic position: Basins, toeslopes, footslopes, and head slopes on volcanic hills
Parent material: Clayey alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 5 percent subrounded cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; clay
Bssg1—2 to 12 inches; clay

Bssg2—12 to 24 inches; clay
Bssg3—24 to 30 inches; clay
2Crtk—30 inches; bedrock

Characteristics of Anita Taxadjunct Clay

Slope: 0 to 12 percent
Geomorphic position: Basins, toeslopes, footslopes, and head slopes on volcanic hills
Parent material: Clayey alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 10 percent subrounded cobbles
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; clay
Bg—2 to 6 inches; clay
Bssg—6 to 11 inches; clay
2Cr—11 inches; bedrock

Minor Components in Map Unit 676

Anita soils with a gravelly duripan and similar soils
Composition: 6 percent
Slope: 0 to 2 percent
Geomorphic position: Basins on strath terraces on volcanic hills
Hydric soil status: Hydric

Loamy soils that are 2 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 0 to 12 percent
Geomorphic position: Knobs on volcanic hills
Hydric soil status: Not hydric

Clearhayes and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

677—Tuscan-Fallager-Anita, gravelly duripan, complex, 0 to 3 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 540 feet (43 to 165 meters)
Mean annual precipitation: 24 to 35 inches (610 to 889 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Tuscan gravelly loam—40 percent
Fallager loam—25 percent
Anita gravelly clay, gravelly duripan—15 percent
Minor components—20 percent

Characteristics of Tuscan Gravelly Loam

Slope: 0 to 3 percent
Geomorphic position: Mounds on strath terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, rounded gravel, 0 to 5 percent rounded cobbles
Depth to a restrictive feature: 10 to 20 inches to a duripan; 11 to 56 inches to paralithic bedrock
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 2 to 20 inches
- *Available water capacity:* Very low (about 1.5 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 7s-8
- *Land capability, nonirrigated:* 7s-8
- *Storie index:* 23 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 2 inches; gravelly loam
- Bt1—2 to 4 inches; clay loam
- Bt2—4 to 7 inches; gravelly clay
- Bt3—7 to 11 inches; cobbly clay
- 2Bqm—11 inches; cemented, gravelly duripan

Characteristics of Fallager Loam

Slope: 0 to 3 percent
Geomorphic position: Swales on strath terraces
Parent material: Loamy alluvium over clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, rounded gravel, 0 to 25 percent rounded cobbles
Depth to a restrictive feature: 4 to 10 inches to a duripan; 5 to 46 inches to paralithic bedrock
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 10 inches
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Storie index: 22 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 1 inch; loam
Bt1—1 to 3 inches; gravelly clay loam
2Bt2—3 to 7 inches; gravelly clay
3Bqm—7 inches; cemented, gravelly duripan

Characteristics of Anita Gravelly Clay, Gravelly Duripan

Slope: 0 to 1 percent
Geomorphic position: Clayey swales on strath terraces
Parent material: Clayey alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Gravelly clay
Percentage of the surface covered by rock fragments: 0 to 10 percent medium, subrounded gravel, 0 to 60 percent subrounded cobbles
Depth to a restrictive feature: 10 to 20 inches to a duripan; 11 to 56 inches to paralithic bedrock
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: Frequent
Depth to a water table (zone of saturation): 0 to 20 inches
Available water capacity: Very low (about 1.7 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7w-2
Land capability, nonirrigated: 7w-2
Storie index: 9 (revised)
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly clay
Bss1—3 to 8 inches; gravelly clay
Bss2—8 to 15 inches; gravelly clay
2Bkqm—15 inches; cemented, gravelly duripan

Minor Components in Map Unit 677

Redtough and similar soils
Composition: 10 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on strath terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools on strath terraces
Hydric soil status: Hydric

Soils that do not have a duripan and are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Mounds on reworked strath terraces
Hydric soil status: Not hydric

Soils that do not have a duripan and are 2 to 10 inches deep to bedrock
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Swales on reworked strath terraces
Hydric soil status: Not hydric

Carhart and similar soils
Composition: 1 percent
Slope: 0 to 3 percent
Geomorphic position: Clay flats on strath terraces
Hydric soil status: Hydric

Soils on riser slopes
Composition: 1 percent
Slope: 10 to 35 percent
Geomorphic position: Riser slopes on strath terraces
Hydric soil status: Not hydric

Soils that are 2 to 20 inches deep to lithic bedrock
Composition: 1 percent
Slope: 0 to 3 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

679—Lucksev-Butteside-Carhart complex, 2 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and homesite development
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 140 to 760 feet (43 to 232 meters)
Mean annual precipitation: 24 to 35 inches (610 to 889 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Lucksev loam—40 percent
Butteside gravelly loam—35 percent
Carhart clay—15 percent
Minor components—10 percent

Characteristics of Lucksev Loam

Slope: 2 to 15 percent
Geomorphic position: Strath terraces and volcanic ridges, buttes, and hills
Parent material: Loamy alluvium and/or residuum over clayey alluvium and/or residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, with blue oak at the higher elevations
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 15 percent fine gravel, 0 to 20 percent cobbles, 0 to 5 percent stones, 0 to 2 percent boulders
Depth to a restrictive feature (paralithic bedrock): 4 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 2 to 20 inches
- *Available water capacity:* Very low (about 2.4 inches)
- *Natural drainage class:* Moderately well drained
- *Surface runoff (bare conditions):* Very high

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 2 inches; loam
- Bt1—2 to 7 inches; clay loam
- Bt2—7 to 15 inches; clay
- 2Crq—15 inches; bedrock

Characteristics of Butteside Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Strath terraces and volcanic ridges, buttes, and hills

Parent material: Loamy alluvium and/or residuum over clayey alluvium and/or residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, with blue oak and foothill pine at the higher elevations
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 15 percent fine gravel, 0 to 25 percent cobbles, 0 to 10 percent stones, 0 to 1 percent boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; clay loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 27 inches; clay
2Crtq—27 inches; bedrock

Characteristics of Carhart Clay

Slope: 2 to 15 percent
Geomorphic position: Footslopes and head slopes on volcanic ridges, buttes, and hills
Parent material: Clayey alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 5 percent subrounded cobbles
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Very high (LEP of more than 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 40 inches
Available water capacity: Low (about 4.5 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; clay
Bssg1—2 to 12 inches; clay
Bssg2—12 to 24 inches; clay
Bssg3—24 to 30 inches; clay
2Crtk—30 inches; bedrock

Minor Components in Map Unit 679

Ultic Haploxeralfs and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Strath terraces and side slopes on volcanic hills
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Strath terraces and side slopes on volcanic hills
Hydric soil status: Not hydric

Fine-loamy soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Strath terraces and side slopes on volcanic hills
Hydric soil status: Not hydric

Anita taxadjunct and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Clay flats on volcanic hills
Hydric soil status: Hydric

Rock outcrop
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Strath terraces and side slopes on volcanic hills
Hydric soil status: Not hydric

Loamy soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Strath terraces and side slopes on volcanic hills
Hydric soil status: Not hydric

680—Lucksev-Butteside complex, 15 to 35 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 180 to 695 feet (55 to 213 meters)
Mean annual precipitation: 25 to 35 inches (635 to 889 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Lucksev loam—45 percent
Butteside gravelly loam—40 percent
Minor components—15 percent

Characteristics of Lucksev Loam

Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Parent material: Loamy colluvium over clayey residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, with blue oak at the higher elevations
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: 0 to 15 percent fine gravel, 0 to 20 percent cobbles, 0 to 5 percent stones, 0 to 2 percent boulders
Depth to a restrictive feature (paralithic bedrock): 4 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; loam
Bt1—2 to 7 inches; clay loam
Bt2—7 to 15 inches; clay
2Crq—15 inches; bedrock

Characteristics of Butteside Gravelly Loam

Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Parent material: Loamy colluvium over clayey residuum weathered from volcanic rocks
Observed vegetation: Annual grasses and forbs, with blue oak, foothill pine, and California buckeye at the higher elevations
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 15 percent fine gravel, 0 to 25 percent cobbles, 0 to 10 percent stones, 0 to 1 percent boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.2 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; clay loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 27 inches; clay
2Crtq—27 inches; bedrock

Minor Components in Map Unit 680

Ultic Haploxeralfs and similar soils
Composition: 4 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

Fine-loamy soils
Composition: 2 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

Loamy soils
Composition: 2 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

Anita taxadjunct and similar soils
Composition: 1 percent
Slope: 15 to 35 percent
Geomorphic position: Side slopes on volcanic ridges, buttes, and hills
Hydric soil status: Not hydric

683—Typic Haploxeralfs, magnesic, low elevation-Earlal-Rock outcrop complex, 3 to 15 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat, watershed, and homesite development

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,495 to 2,400 feet (457 to 732 meters)
Mean annual precipitation: 45 to 55 inches (1,143 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Typic Haploxeralfs, magnesic, low elevation—50 percent
Earlal very gravelly loam—20 percent
Rock outcrop (serpentinite)—15 percent
Minor components—15 percent

Characteristics of Typic Haploxeralfs, Magnesic, Low Elevation

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on serpentinite mountains
Parent material: Gravelly and clayey colluvium and/or residuum weathered from serpentinite
Observed vegetation: Manzanita, buckbrush, California laurel, foothill pine, canyon live oak, and blue oak
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 10 inches; very gravelly clay loam
Bt2—10 to 21 inches; very cobbly clay loam
Bt3—21 to 30 inches; very gravelly clay
R—30 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on serpentinite mountains
Parent material: Gravelly residuum weathered from serpentinite
Observed vegetation: Whiteleaf manzanita, foothill pine, buckbrush, canyon live oak, California laurel, blue oak, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam

Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Characteristics of Rock Outcrop (Serpentinite)

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on serpentinite mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 683

At an elevation of less than 1,700 feet, soils with a thermic soil temperature regime
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic hills
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to bedrock
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on serpentinite mountains
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Millerridge and similar soils
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

684—Typic Haploxeralfs, magnesic, low elevation-Earlal-Rock outcrop complex, 15 to 30 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,640 to 2,335 feet (500 to 713 meters)
Mean annual precipitation: 45 to 55 inches (1,143 to 1,397 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 230 to 250 days

Map Unit Composition

Typic Haploxeralfs, magnesic, low elevation—50 percent
Earlal very gravelly loam—20 percent
Rock outcrop (serpentinite)—15 percent
Minor components—15 percent

Characteristics of Typic Haploxeralfs, Magnesic, Low Elevation

Slope: 15 to 30 percent
Geomorphic position: Side slopes on serpentinite mountains
Parent material: Gravelly and clayey residuum and/or colluvium derived from serpentinite
Observed vegetation: Manzanita, buckbrush, California laurel, foothill pine, canyon live oak, and blue oak
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 25 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 2.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 10 inches; very gravelly clay loam
Bt2—10 to 21 inches; very cobbly clay loam
Bt3—21 to 30 inches; very gravelly clay
R—30 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on serpentinite mountains
Parent material: Gravelly residuum and/or colluvium derived from serpentinite
Observed vegetation: Whiteleaf manzanita, foothill pine, buckbrush, canyon live oak, California laurel, blue oak, toyon, and annual grasses and forbs
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Characteristics of Rock Outcrop (Serpentinite)

Slope: 15 to 30 percent
Geomorphic position: Side slopes on serpentinite mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 684

At an elevation of less than 1,700 feet, soils with a thermic soil temperature regime
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic hills
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on serpentinite mountains
Hydric soil status: Not hydric

Boxrobber and similar soils
Composition: 1 percent
Slope: 15 to 30 percent

Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Millerridge and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

685—Bosquejo taxadjunct clay, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, and cropland
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 170 to 535 feet (53 to 164 meters)
Mean annual precipitation: 24 to 30 inches (610 to 762 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 255 days

Map Unit Composition

Bosquejo taxadjunct, gravelly substratum—70 percent
Minor components—30 percent

Characteristics of Bosquejo Taxadjunct, Gravelly Substratum

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Clayey alluvium over gravelly alluvium over sandy alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs
Texture of the surface layer: Clay
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 3 percent subrounded cobbles
Depth to a restrictive feature: 40 to 80 inches to dense material; 80 to 180 inches to paralithic bedrock
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: Occasional
Depth to a water table (zone of saturation): 12 to 60 inches
Available water capacity: Moderate (about 5.7 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 5w-5
Land capability, nonirrigated: 5w-5
Storie index: 34 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; clay

A2—3 to 8 inches; clay
Bss1—8 to 17 inches; clay
Bss2—17 to 27 inches; clay
2Btq1—27 to 33 inches; gravelly clay
2Btq2—33 to 41 inches; very gravelly sandy clay
2Btq3—41 to 55 inches; very gravelly sandy clay
3Bdq1—55 to 70 inches; dense sandy loam
3Bdq2—70 to 81 inches; dense sandy loam

Minor Components in Map Unit 685

Bosquejo taxadjunct clay loam and similar soils
Composition: 12 percent
Slope: 0 to 2 percent
Geomorphic position: Bars on stream terraces
Hydric soil status: Not hydric

Redsluff taxadjunct and similar soils
Composition: 7 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Hamslough and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Channels on stream terraces
Hydric soil status: Hydric

Clearhayes and similar soils
Composition: 3 percent
Slope: 0 to 1 percent
Geomorphic position: Low strath terraces
Hydric soil status: Not hydric

Butteside and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Strath terraces
Hydric soil status: Not hydric

Soils that are frequently ponded for long periods
Composition: 1 percent
Slope: 0 to 1 percent
Geomorphic position: Vernal pools and channels on stream terraces
Hydric soil status: Hydric

686—Redsluff taxadjunct clay loam, 0 to 2 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, watershed, cropland, and homesite development
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 150 to 600 feet (46 to 183 meters)
Mean annual precipitation: 26 to 36 inches (660 to 914 millimeters)

Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Redsluff taxadjunct clay loam—70 percent
Minor components—30 percent

Characteristics of Redsluff Taxadjunct Clay Loam

Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Parent material: Clayey alluvium derived from volcanic rocks over gravelly alluvium derived from andesite
Observed vegetation: Annual grasses and forbs, valley oak, foothill pine, blue oak, California sycamore, Douglas sagewort, and Pacific poison oak
Texture of the surface layer: Clay loam
Percentage of the surface covered by rock fragments: 0 to 5 percent medium, subrounded gravel, 0 to 3 percent subrounded cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 85 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 36 to 60 inches
Available water capacity: High (about 9.0 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2s-11
Land capability, nonirrigated: 3s-11
Storie index: 80 (revised)
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Ap—0 to 4 inches; clay loam
Bt1—4 to 10 inches; sandy clay
Bt2—10 to 21 inches; clay loam
Bt3—21 to 32 inches; sandy clay loam
Bt4—32 to 42 inches; sandy clay loam
2Bt5—42 to 53 inches; gravelly clay loam
2Bt6—53 to 68 inches; extremely gravelly sandy clay loam
2Bt7—68 to 75 inches; gravelly sandy clay loam
3Cr—75 to 80 inches; bedrock

Minor Components in Map Unit 686

Bosquejo taxadjunct clay and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to a duripan
Composition: 5 percent
Slope: 0 to 2 percent

Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Redsluff taxadjunct, nongravelly, and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Redsluff taxadjunct, occasionally flooded, and similar soils
Composition: 5 percent
Slope: 0 to 1 percent
Geomorphic position: Low stream terraces
Hydric soil status: Not hydric

Redsluff and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Stream terraces
Hydric soil status: Not hydric

Clearhayes and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Low strath terraces
Hydric soil status: Not hydric

687—Xerorthents, shallow-Typic Haploxeralfs complex, 2 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Livestock grazing, homesite development, wildlife habitat, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 275 to 1,000 feet (85 to 305 meters)
Mean annual precipitation: 27 to 32 inches (686 to 813 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Xerorthents, shallow—45 percent
Typic Haploxeralfs gravelly loam—40 percent
Minor components—15 percent

Characteristics of Xerorthents, Shallow

Slope: 2 to 15 percent
Geomorphic position: Footslopes in canyons
Parent material: Loamy residuum, colluvium, and/or alluvium derived from volcanic rocks
Observed vegetation: Annual grasses and forbs, buckbrush, and blue oak
Texture of the surface layer: Gravelly clay loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 40 percent subangular stones, 0 to 40 percent subangular boulders

Depth to a restrictive feature: 2 to 20 inches to paralithic bedrock; 2 to 20 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.1 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7s-8
Land capability, nonirrigated: 7s-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; gravelly clay loam
Bt1—2 to 5 inches; gravelly clay loam
Bt2—5 to 8 inches; very cobbly clay loam
2R—8 inches; bedrock

Characteristics of Typic Haploxeralfs Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Footslopes in canyons
Parent material: Loamy residuum, colluvium, and/or alluvium derived from volcanic rocks
Observed vegetation: Interior live oak, blue oak, foothill pine, buckbrush, manzanita, Pacific poison oak, toyon, and annual grasses and forbs
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 0 to 25 percent fine, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature: 20 to 60 inches to paralithic bedrock; 20 to 60 inches to lithic bedrock
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 2 inches; gravelly loam
Bt1—2 to 8 inches; gravelly clay loam
Bt2—8 to 16 inches; very gravelly clay loam

Bt3—16 to 27 inches; very gravelly clay loam
Bt4—27 to 40 inches; very gravelly clay loam
2Cr—40 inches; bedrock

Minor Components in Map Unit 687

Rock outcrop
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Lithic Haploxeralfs and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Footslopes in canyons
Hydric soil status: Not hydric

Carhart and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Areas around seeps on footslopes in canyons
Hydric soil status: Hydric

Aquic Durixeralfs and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Drainageways on footslopes in canyons
Hydric soil status: Hydric

700—Retsongulch-Flumewall complex, 70 to 100 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Watershed, wildlife habitat, and timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 4,595 feet (610 to 1,402 meters)
Mean annual precipitation: 70 to 78 inches (1,778 to 1,981 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 170 days

Map Unit Composition

Retsongulch very gravelly sandy loam—40 percent
Flumewall gravelly sandy loam—25 percent
Minor components—35 percent

Characteristics of Retsongulch Very Gravelly Sandy Loam

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, tanoak, canyon live oak, ponderosa pine, California black oak, incense cedar, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 15 to 80 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly sandy loam
Bt1—3 to 12 inches; very gravelly sandy clay loam
Bt2—12 to 21 inches; extremely gravelly sandy clay loam
Bt3—21 to 30 inches; extremely gravelly sandy loam
R—30 inches; bedrock

Characteristics of Flumewall Gravelly Sandy Loam

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Canyon live oak, Douglas-fir, ponderosa pine, tanoak, California black oak, incense cedar, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 25 percent medium, angular gravel, 0 to 25 percent angular cobbles, 0 to 15 percent angular stones
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 2 inches; gravelly sandy loam

Bt1—2 to 7 inches; very gravelly sandy loam
Bt2—7 to 18 inches; extremely stony sandy clay loam
R—18 inches; bedrock

Minor Components in Map Unit 700

Rock outcrop
Composition: 10 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 2 to 10 inches deep to bedrock
Composition: 10 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Obskel and similar soils
Composition: 8 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Obstruction and similar soils
Composition: 7 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

701—Powellton-Obstruction complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,200 to 3,595 feet (671 to 1,097 meters)
Mean annual precipitation: 67 to 72 inches (1,702 to 1,829 millimeters)
Mean annual air temperature: 54 degrees F (12 degrees C)
Frost-free period: 150 to 175 days

Map Unit Composition

Powellton gravelly loam—40 percent
Obstruction gravelly sandy loam—30 percent
Minor components—30 percent

Characteristics of Powellton Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, tanoak, canyon live oak, and deerbrush

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 15 inches; loam
Bt3—15 to 24 inches; clay loam
Bt4—24 to 30 inches; clay loam
Bt5—30 to 41 inches; silt loam
Bt6—41 to 61 inches; loam
Bt7—61 to 83 inches; loam

Characteristics of Obstruction Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, tanoak, canyon live oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent fine, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 96 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 4 inches; slightly decomposed plant material
A—4 to 7 inches; gravelly sandy loam
Bt1—7 to 10 inches; gravelly sandy clay loam
Bt2—10 to 18 inches; gravelly fine sandy loam
Bt3—18 to 25 inches; gravelly sandy clay loam
Bt4—25 to 33 inches; sandy clay loam
Bt5—33 to 44 inches; fine sandy loam
Bt6—44 to 64 inches; gravelly fine sandy loam
Bt7—64 to 84 inches; gravelly fine sandy loam
Cr—84 inches; bedrock

Minor Components in Map Unit 701

Obskel and similar soils
Composition: 12 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Retsongulch and similar soils
Composition: 8 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Coarse-loamy soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

702—Cerpone-Typic Haploxeralfs, magnesic-Earlal complex, 3 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,595 to 3,395 feet (792 to 1,036 meters)
Mean annual precipitation: 55 to 65 inches (1,397 to 1,651 millimeters)

Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 185 to 230 days

Map Unit Composition

Cerpone gravelly loam—50 percent
Typic Haploxeralfs, magnesic, very gravelly loam—20 percent
Earlal very gravelly loam—15 percent
Minor components—15 percent

Characteristics of Cerpone Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Parent material: Fine-loamy residuum weathered from ultramafic rocks
Observed vegetation: Jeffrey pine, incense cedar, ponderosa pine, foothill pine, whiteleaf manzanita, California laurel, and buckbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-9
Land capability, nonirrigated: 3e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 17 inches; cobbly loam
Bt3—17 to 26 inches; gravelly clay loam
Bt4—26 to 41 inches; very gravelly silty clay loam
Bt5—41 to 57 inches; very gravelly silty clay loam
R—57 inches; bedrock

Characteristics of Typic Haploxeralfs, Magnesic, Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Parent material: Gravelly and clayey residuum weathered from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, and scattered Jeffrey pine and incense cedar
Texture of the surface layer: Very gravelly loam

Percentage of the surface covered by rock fragments: 10 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; gravelly clay loam
Bt2—7 to 12 inches; very gravelly clay loam
Bt3—12 to 18 inches; gravelly clay
Bt4—18 to 24 inches; very gravelly clay
Btss1—24 to 32 inches; very gravelly clay
Btss2—32 to 42 inches; very gravelly clay
B´t5—42 to 54 inches; extremely cobbly clay loam
R—54 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Parent material: Gravelly residuum weathered from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, Jeffrey pine, and ponderosa pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Minor Components in Map Unit 702

Rock outcrop
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

703—Cerpone-Typic Haploxeralfs, magnesic-Earlal-Rock outcrop complex, 15 to 30 percent slopes.

Map Unit Setting

General location: Eastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,200 to 3,595 feet (671 to 1,097 meters)
Mean annual precipitation: 52 to 65 inches (1,321 to 1,651 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 185 to 235 days

Map Unit Composition

Cerpone gravelly loam—30 percent
Typic Haploxeralfs, magnesic, very gravelly loam—30 percent
Earlal very gravelly loam—15 percent
Rock outcrop (serpentinite)—15 percent
Minor components—10 percent

Characteristics of Cerpone Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from ultramafic rocks
Observed vegetation: Jeffrey pine, incense cedar, ponderosa pine, foothill pine, whiteleaf manzanita, California laurel, and buckbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium,

subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-9
Land capability, nonirrigated: 4e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 17 inches; cobbly loam
Bt3—17 to 26 inches; gravelly clay loam
Bt4—26 to 41 inches; very gravelly silty clay loam
Bt5—41 to 57 inches; very gravelly silty clay loam
R—57 inches; bedrock

Characteristics of Typic Haploxeralfs, Magnesic, Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Parent material: Gravelly and clayey residuum and/or colluvium derived from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, and scattered Jeffrey pine and incense cedar
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; gravelly clay loam
Bt2—7 to 12 inches; very gravelly clay loam
Bt3—12 to 18 inches; gravelly clay
Bt4—18 to 24 inches; very gravelly clay
Btss1—24 to 32 inches; very gravelly clay
Btss2—32 to 42 inches; very gravelly clay
B´t5—42 to 54 inches; extremely cobbly clay loam
R—54 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Parent material: Gravelly residuum weathered from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, Jeffrey pine, and ponderosa pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Characteristics of Rock Outcrop (Serpentinite)

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on ultramafic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 703

Griffgulch and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Spine taxadjunct and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

704—Typic Haploxeralfs, magnesic-Earlal-Cerpone-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,000 to 3,545 feet (305 to 1,082 meters)
Mean annual precipitation: 52 to 65 inches (1,321 to 1,651 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 185 to 235 days

Map Unit Composition

Typic Haploxeralfs, magnesic, very gravelly loam—40 percent
Earlal very gravelly loam—20 percent
Cerpone gravelly loam—15 percent
Rock outcrop (serpentinite)—15 percent
Minor components—10 percent

Characteristics of Typic Haploxeralfs, Magnesic, Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on ultramafic mountains
Parent material: Gravelly and clayey colluvium derived from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, and scattered Jeffrey pine and incense cedar
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; gravelly clay loam
Bt2—7 to 12 inches; very gravelly clay loam
Bt3—12 to 18 inches; gravelly clay
Bt4—18 to 24 inches; very gravelly clay
Btss1—24 to 32 inches; very gravelly clay
Btss2—32 to 42 inches; very gravelly clay
B´t5—42 to 54 inches; extremely cobbly clay loam
R—54 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on ultramafic mountains
Parent material: Gravelly colluvium and/or residuum weathered from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, Jeffrey pine, and ponderosa pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Characteristics of Cerpone Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on ultramafic mountains
Parent material: Fine-loamy colluvium derived from ultramafic rocks
Observed vegetation: Jeffrey pine, incense cedar, ponderosa pine, foothill pine, whiteleaf manzanita, California laurel, and buckbrush

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-9
Land capability, nonirrigated: 6e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 17 inches; cobbly loam
Bt3—17 to 26 inches; gravelly clay loam
Bt4—26 to 41 inches; very gravelly silty clay loam
Bt5—41 to 57 inches; very gravelly silty clay loam
R—57 inches; bedrock

Characteristics of Rock Outcrop (Serpentinite)

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on ultramafic mountains
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 704

At an elevation of less than 1,600 feet, soils with a thermic soil temperature regime
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on ultramafic mountains
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Spine taxadjunct and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

705—Typic Haploxeralfs, magnesic-Earlal-Cerpone-Rock outcrop complex, 50 to 80 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 895 to 3,395 feet (274 to 1,036 meters)
Mean annual precipitation: 42 to 65 inches (1,067 to 1,651 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 185 to 250 days

Map Unit Composition

Typic Haploxeralfs, magnesic, very gravelly loam—35 percent
Earlal very gravelly loam—25 percent
Cerpone gravelly loam—15 percent
Rock outcrop (serpentinite)—15 percent
Minor components—10 percent

Characteristics of Typic Haploxeralfs, Magnesic, Very Gravelly Loam

Slope: 50 to 80 percent
Geomorphic position: Backslopes on ultramafic mountains and in canyons
Parent material: Gravelly and clayey colluvium derived from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, and scattered Jeffrey pine and incense cedar
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 10 to 80 percent medium, subangular gravel, 5 to 35 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 15 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 80 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; gravelly clay loam
Bt2—7 to 12 inches; very gravelly clay loam
Bt3—12 to 18 inches; gravelly clay
Bt4—18 to 24 inches; very gravelly clay
Btss1—24 to 32 inches; very gravelly clay
Btss2—32 to 42 inches; very gravelly clay
B´t5—42 to 54 inches; extremely cobbly clay loam
R—54 inches; bedrock

Characteristics of Earlal Very Gravelly Loam

Slope: 50 to 80 percent
Geomorphic position: Backslopes on ultramafic mountains and in canyons
Parent material: Gravelly colluvium derived from serpentinite
Observed vegetation: Annual grasses and forbs, whiteleaf manzanita, buckbrush, foothill pine, Jeffrey pine, and ponderosa pine
Texture of the surface layer: Very gravelly loam
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, angular gravel, 20 to 30 percent angular cobbles, 10 to 20 percent angular stones, 5 to 15 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; very gravelly loam
Bt1—3 to 7 inches; very gravelly clay loam
Bt2—7 to 14 inches; extremely gravelly clay loam
R—14 inches; bedrock

Characteristics of Cerpone Gravelly Loam

Slope: 50 to 80 percent
Geomorphic position: Backslopes on ultramafic mountains and in canyons
Parent material: Fine-loamy colluvium derived from ultramafic rocks
Observed vegetation: Jeffrey pine, incense cedar, ponderosa pine, foothill pine, whiteleaf manzanita, California laurel, and buckbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 10 percent subangular stones

Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-9
Land capability, nonirrigated: 7e-9
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 17 inches; cobbly loam
Bt3—17 to 26 inches; gravelly clay loam
Bt4—26 to 41 inches; very gravelly silty clay loam
Bt5—41 to 57 inches; very gravelly silty clay loam
R—57 inches; bedrock

Characteristics of Rock Outcrop (Serpentinite)

Slope: 50 to 80 percent
Geomorphic position: Backslopes on ultramafic mountains and in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 705

Spine taxadjunct and similar soils
Composition: 3 percent
Slope: 50 to 80 percent
Geomorphic position: Backslopes on metavolcanic mountains and in canyons
Hydric soil status: Not hydric

At an elevation of less than 1,600 feet, soils with a thermic soil temperature regime
Composition: 3 percent
Slope: 50 to 80 percent
Geomorphic position: Backslopes on ultramafic hills and in canyons
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 2 percent
Slope: 50 to 80 percent
Geomorphic position: Backslopes on metavolcanic mountains and in canyons
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 2 percent
Slope: 50 to 80 percent

Geomorphic position: Backslopes on metavolcanic mountains and in canyons
Hydric soil status: Not hydric

711—Dixmine-Toadtown complex, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,415 to 3,490 feet (1,042 to 1,064 meters)
Mean annual precipitation: 67 inches (1,702 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 180 days

Map Unit Composition

Dixmine very gravelly loam—45 percent
Toadtown loam—40 percent
Minor components—15 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Parent material: Gravelly, loamy and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.2 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- Oe—1 to 2 inches; moderately decomposed plant material
- A—2 to 6 inches; very gravelly loam
- Bt1—6 to 11 inches; very gravelly loam
- Bt2—11 to 17 inches; gravelly loam
- Bt3—17 to 30 inches; very cobbly clay loam

Bt4—30 to 41 inches; very gravelly clay loam
Bt5—41 to 54 inches; extremely cobbly clay loam
Cr—54 inches; bedrock

Characteristics of Toadtown Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Parent material: Loamy and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 5 inches; loam
Bt1—5 to 8 inches; loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 18 inches; clay
Bt4—18 to 27 inches; clay
Bt5—27 to 51 inches; clay loam
Bt6—51 to 65 inches; loam
Bt7—65 to 75 inches; loam
Crt—75 to 79 inches; loam

Minor Components in Map Unit 711

Mac and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Nonskeletal soils that are 40 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

712—Dixmine-Toadtown complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 3,595 feet (975 to 1,097 meters)
Mean annual precipitation: 62 to 72 inches (1,575 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 155 to 190 days

Map Unit Composition

Dixmine very gravelly loam—50 percent
Toadtown loam—40 percent
Minor components—10 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metavolcanic mountains
Parent material: Gravelly, loamy and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 11 inches; very gravelly loam
Bt2—11 to 17 inches; gravelly loam
Bt3—17 to 30 inches; very cobbly clay loam
Bt4—30 to 41 inches; very gravelly clay loam
Bt5—41 to 54 inches; extremely cobbly clay loam
Cr—54 inches; bedrock

Characteristics of Toadtown Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metavolcanic mountains
Parent material: Loamy and clayey colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush

Nonskeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metavolcanic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metavolcanic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metamorphic mountains
Hydric soil status: Not hydric

713—Dixmine-Toadtown complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,995 to 3,595 feet (914 to 1,097 meters)
Mean annual precipitation: 62 to 73 inches (1,575 to 1,854 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 155 to 190 days

Map Unit Composition

Dixmine very gravelly loam—50 percent
Toadtown loam—35 percent
Minor components—15 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic mountains
Parent material: Gravelly, loamy and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones

Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 11 inches; very gravelly loam
Bt2—11 to 17 inches; gravelly loam
Bt3—17 to 30 inches; very cobbly clay loam
Bt4—30 to 41 inches; very gravelly clay loam
Bt5—41 to 54 inches; extremely cobbly clay loam
Cr—54 inches; bedrock

Characteristics of Toadtown Loam

Nonskeletal soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic mountains
Hydric soil status: Not hydric

Haploxerults, loamy-skeletal, more than 60 inches deep to bedrock, and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metavolcanic mountains
Hydric soil status: Not hydric

Spine and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

714—Dixmine-Toadtown complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains

Elevation: 2,200 to 3,195 feet (671 to 975 meters)
Mean annual precipitation: 62 to 73 inches (1,575 to 1,854 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 155 to 190 days

Map Unit Composition

Dixmine very gravelly loam—50 percent
Toadtown loam—35 percent
Minor components—15 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic mountains
Parent material: Gravelly, loamy and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, white fir, tanoak, sugar pine, California black oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material

Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metavolcanic mountains
Hydric soil status: Not hydric

715—Logtrain-Bottlehill-Walkermine complex, 70 to 110 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,895 to 3,395 feet (579 to 1,036 meters)
Mean annual precipitation: 67 to 72 inches (1,702 to 1,829 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 145 to 175 days

Map Unit Composition

Logtrain gravelly loam—40 percent
Bottlehill very gravelly loam—30 percent
Walkermine very gravelly loam—20 percent
Minor components—10 percent

Characteristics of Logtrain Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, tanoak, ponderosa pine, California black oak, canyon live oak, incense cedar, bigleaf maple, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 21 inches; very gravelly loam
Bt3—21 to 38 inches; very cobbly loam
Bt4—38 to 54 inches; extremely gravelly loam
R—54 inches; bedrock

Characteristics of Bottlehill Very Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, tanoak, ponderosa pine, California black oak, canyon live oak, incense cedar, bigleaf maple, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam
A2—4 to 9 inches; very gravelly loam
Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Walkermine Very Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, tanoak, ponderosa pine, California black oak, canyon live oak, incense cedar, and bigleaf maple
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 75 percent coarse, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 4 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt—3 to 12 inches; very gravelly loam
R—12 inches; bedrock

Minor Components in Map Unit 715

Rock outcrop
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Scree
Composition: 2 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

716—Griffgulch-Surnuf complex, 3 to 15 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,280 to 3,195 feet (695 to 975 meters)
Mean annual precipitation: 53 to 62 inches (1,346 to 1,575 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 180 to 240 days

Map Unit Composition

Griffgulch very gravelly silt loam—40 percent
Surnuf gravelly loam—40 percent
Minor components—20 percent

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Parent material: Cobbly, silty and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.4 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- Oe—2 to 3 inches; moderately decomposed plant material
- A—3 to 7 inches; very gravelly silt loam
- Bt1—7 to 11 inches; very cobbly silty clay loam
- Bt2—11 to 20 inches; extremely cobbly silty clay loam
- Bt3—20 to 33 inches; very cobbly silty clay
- Bt4—33 to 47 inches; very cobbly clay
- Bt5—47 to 58 inches; extremely gravelly clay
- R—58 inches; bedrock

Characteristics of Surnuf Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Parent material: Silty and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 2 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Minor Components in Map Unit 716

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 7 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 6 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Spine taxadjunct and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metavolcanic mountains
Hydric soil status: Not hydric

717—Griffgulch-Surnuf complex, 15 to 30 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,200 to 3,355 feet (366 to 1,024 meters)
Mean annual precipitation: 53 to 62 inches (1,346 to 1,575 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 180 to 240 days

Map Unit Composition

Griffgulch very gravelly silt loam—40 percent
Surnuf gravelly loam—40 percent
Minor components—20 percent

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Parent material: Cobbly, silty and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Characteristics of Surnuf Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Parent material: Silty and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 2 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Minor Components in Map Unit 717

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 7 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Spine taxadjunct and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metavolcanic mountains
Hydric soil status: Not hydric

718—Griffgulch-Surnuf-Spine taxadjunct complex, 30 to 50 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 915 to 3,595 feet (280 to 1,097 meters)
Mean annual precipitation: 46 to 65 inches (1,168 to 1,651 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 180 to 240 days

Map Unit Composition

Griffgulch very gravelly silt loam—35 percent
Surnuf gravelly loam—35 percent

Spine taxadjunct very cobbly loam—15 percent
Minor components—15 percent

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Parent material: Cobbly, silty and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Characteristics of Surnuf Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Parent material: Silty and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, whiteleaf manzanita, canyon live oak, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 2 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Spine Taxadjunct Very Cobbly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Parent material: Cobbly and loamy residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, canyon live oak, whiteleaf manzanita, California black oak, tanoak, Douglas-fir, Pacific poison oak, and deerbrush
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 25 to 80 percent medium, subangular gravel, 5 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very cobbly loam
Bt—2 to 15 inches; very cobbly clay loam
R—15 inches; bedrock

Minor Components in Map Unit 718

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in canyons and on metavolcanic mountains
Hydric soil status: Not hydric

719—Griffgulch-Surnuf-Spine taxadjunct complex, 50 to 70 percent slopes

Map Unit Setting

General location: East-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 960 to 2,995 feet (293 to 914 meters)
Mean annual precipitation: 45 to 62 inches (1,143 to 1,575 millimeters)
Mean annual air temperature: 55 to 57 degrees F (13 to 14 degrees C)
Frost-free period: 180 to 240 days

Map Unit Composition

Griffgulch very gravelly silt loam—35 percent
Surnuf gravelly loam—30 percent
Spine taxadjunct very cobbly loam—20 percent
Minor components—15 percent

Characteristics of Griffgulch Very Gravelly Silt Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons

Parent material: Cobbly, silty and clayey colluvium derived from metavolcanic rocks
Observed vegetation: Canyon live oak, scrub oak, tanoak, California laurel, California black oak, Douglas-fir, ponderosa pine, foothill pine, Pacific poison oak, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 30 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 7 inches; very gravelly silt loam
Bt1—7 to 11 inches; very cobbly silty clay loam
Bt2—11 to 20 inches; extremely cobbly silty clay loam
Bt3—20 to 33 inches; very cobbly silty clay
Bt4—33 to 47 inches; very cobbly clay
Bt5—47 to 58 inches; extremely gravelly clay
R—58 inches; bedrock

Characteristics of Surnuf Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Silty and clayey colluvium derived from metavolcanic rocks
Observed vegetation: Canyon live oak, scrub oak, tanoak, California laurel, California black oak, Douglas-fir, ponderosa pine, foothill pine, Pacific poison oak, and whiteleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 2 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Spine Taxadjunct Very Cobbly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Cobbly and loamy residuum weathered from metavolcanic rocks
Observed vegetation: Canyon live oak, scrub oak, tanoak, California laurel, California black oak, Douglas-fir, ponderosa pine, foothill pine, Pacific poison oak, and whiteleaf manzanita
Texture of the surface layer: Very cobbly loam
Percentage of the surface covered by rock fragments: 25 to 80 percent medium, subangular gravel, 5 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 2 inches; very cobbly loam
Bt—2 to 15 inches; very cobbly clay loam
R—15 inches; bedrock

Minor Components in Map Unit 719

Rock outcrop
Composition: 4 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

720—Dystroxerepts-Haploxeralfs-Rock outcrop complex, 70 to 110 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 18
Landscape: Northern Sierra Nevada foothills
Elevation: 675 to 2,595 feet (207 to 792 meters)
Mean annual precipitation: 40 to 67 inches (1,016 to 1,702 millimeters)
Mean annual air temperature: 54 to 61 degrees F (12 to 16 degrees C)
Frost-free period: 185 to 260 days

Map Unit Composition

Dystroxerepts extremely gravelly loam—40 percent
Haploxeralfs very gravelly loam—30 percent
Rock outcrop (metavolcanic)—15 percent
Minor components—15 percent

Characteristics of Dystroxerepts Extremely Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Canyon live oak, scrub oak, foothill pine, California laurel, whiteleaf manzanita, buckbrush, toyon, Pacific poison oak, blue oak, interior live oak, and scattered Douglas-fir and ponderosa pine
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 10 to 50 percent angular gravel, 10 to 30 percent angular cobbles, 10 to 30 percent angular stones, 0 to 30 percent angular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; extremely gravelly loam
Bt1—4 to 12 inches; extremely gravelly clay loam
Bt2—12 to 22 inches; extremely gravelly clay loam
Bt3—22 to 28 inches; extremely gravelly loam
Bt4—28 to 38 inches; extremely cobbly sandy clay loam
R—38 inches; bedrock

Characteristics of Haploxeralfs Very Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Canyon live oak, scrub oak, foothill pine, California laurel, whiteleaf manzanita, buckbrush, toyon, Pacific poison oak, blue oak, interior live oak, and scattered Douglas-fir and ponderosa pine
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 50 percent coarse, subangular gravel, 5 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; very gravelly loam
Bt1—4 to 9 inches; very gravelly clay loam
Bt2—9 to 13 inches; very gravelly clay loam
Bt3—13 to 22 inches; extremely gravelly clay loam
Bt4—22 to 31 inches; extremely gravelly clay loam
Bt5—31 to 47 inches; extremely gravelly clay loam
R—47 inches; bedrock

Characteristics of Rock Outcrop (Metavolcanic)

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 720

Soils that are less than 20 inches deep to lithic bedrock
Composition: 7 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Griffgulch and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Mounthope and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Surnuf and similar soils
Composition: 1 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Typic Haploxeralfs, magnesic, and similar soils
Composition: 1 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

721—Haploxerands, granitic till, 2 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,700 to 5,800 feet (1,433 to 1,768 meters)

Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, granitic till, medial sandy loam—70 percent
Minor components—30 percent

Characteristics of Haploxerands, Granitic Till, Medial Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on moraines
Parent material: Bouldery and sandy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; medial sandy loam
A2—5 to 12 inches; medial sandy loam
AB—12 to 22 inches; stony medial sandy loam
2Bw1—22 to 41 inches; stony coarse sandy loam
2Bw2—41 to 55 inches; extremely bouldery coarse sandy loam
2Bw3—55 to 74 inches; extremely cobbly loamy coarse sand
2Bw4—74 to 87 inches; extremely bouldery loamy coarse sand

Minor Components in Map Unit 721

Haploxerands, volcanic till, and similar soils
Composition: 10 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on moraines
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to bedrock
Composition: 10 percent
Slope: 2 to 15 percent

Geomorphic position: Ridgetops and footslopes on moraines
Hydric soil status: Not hydric

Haploxerands and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Outwash terraces
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Meadows in mountain valleys
Hydric soil status: Hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on mountains
Hydric soil status: Not hydric

722—Haploxerands, granitic till, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,900 to 5,600 feet (1,189 to 1,707 meters)
Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, granitic till, medial sandy loam—70 percent
Minor components—30 percent

Characteristics of Haploxerands, Granitic Till, Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on moraines
Parent material: Bouldery and sandy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; medial sandy loam
A2—5 to 12 inches; medial sandy loam
AB—12 to 22 inches; stony medial sandy loam
2Bw1—22 to 41 inches; stony coarse sandy loam
2Bw2—41 to 55 inches; extremely bouldery coarse sandy loam
2Bw3—55 to 74 inches; extremely cobbly loamy coarse sand
2Bw4—74 to 87 inches; extremely bouldery loamy coarse sand

Minor Components in Map Unit 722

Soils that are 20 to 60 inches deep to bedrock
Composition: 11 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Haploxerands, volcanic till, and similar soils
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Rock outcrop
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on mountains
Hydric soil status: Not hydric

Haploxerands and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Outwash terraces
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Meadows in mountain valleys
Hydric soil status: Hydric

723—Haploxerands, granitic till, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,995 to 5,800 feet (1,219 to 1,768 meters)
Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, granitic till, medial sandy loam—70 percent
Minor components—30 percent

Characteristics of Haploxerands, Granitic Till, Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Parent material: Bouldery and sandy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; medial sandy loam
A2—5 to 12 inches; medial sandy loam
AB—12 to 22 inches; stony medial sandy loam
2Bw1—22 to 41 inches; stony coarse sandy loam
2Bw2—41 to 55 inches; extremely bouldery coarse sandy loam
2Bw3—55 to 74 inches; extremely cobbly loamy coarse sand
2Bw4—74 to 87 inches; extremely bouldery loamy coarse sand

Minor Components in Map Unit 723

Soils that are 20 to 60 inches deep to bedrock
Composition: 12 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Haploxerands, volcanic till, and similar soils
Composition: 11 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Rock outcrop
Composition: 7 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on mountains
Hydric soil status: Not hydric

724—Haploxerands, volcanic till, 2 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada and Southern Cascade Mountains
Elevation: 4,235 to 5,600 feet (1,292 to 1,707 meters)
Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, volcanic till, cobbly medial sandy loam—75 percent
Minor components—25 percent

Characteristics of Haploxerands, Volcanic Till, Cobbly Medial Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on moraines
Parent material: Bouldery and loamy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; cobbly medial sandy loam
Bw—4 to 17 inches; cobbly medial sandy loam
Bt1—17 to 37 inches; gravelly sandy loam
Bt2—37 to 41 inches; gravelly sandy loam
2Cd1—41 to 52 inches; gravelly, dense glacial till
2Cd2—52 to 80 inches; gravelly, dense glacial till

Minor Components in Map Unit 724

Soils that are 20 to 60 inches deep to bedrock
Composition: 10 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on moraines
Hydric soil status: Not hydric

Haploxerands, granitic till, and similar soils
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on moraines
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on mountains
Hydric soil status: Not hydric

Haploxerands and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Outwash terraces
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in mountain valleys
Hydric soil status: Hydric

725—Haploxerands, volcanic till, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada and Southern Cascade Mountains
Elevation: 4,235 to 5,695 feet (1,292 to 1,737 meters)
Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, volcanic till, cobbly medial sandy loam—75 percent
Minor components—25 percent

Characteristics of Haploxerands, Volcanic Till, Cobbly Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on moraines
Parent material: Bouldery and loamy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; cobbly medial sandy loam
Bw—4 to 17 inches; cobbly medial sandy loam
Bt1—17 to 37 inches; gravelly sandy loam
Bt2—37 to 41 inches; gravelly sandy loam
2Cd1—41 to 52 inches; gravelly, dense glacial till
2Cd2—52 to 80 inches; gravelly, dense glacial till

Minor Components in Map Unit 725

Soils that are 20 to 60 inches deep to bedrock
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on moraines
Hydric soil status: Not hydric

Haploxerands, granitic till, and similar soils
Composition: 7 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on moraines
Hydric soil status: Not hydric

Rock outcrop
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on mountains
Hydric soil status: Not hydric

Haploxerands and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Outwash terraces
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 1 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in mountain valleys
Hydric soil status: Hydric

726—Haploxerands, volcanic till, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada and Southern Cascade Mountains
Elevation: 4,235 to 5,400 feet (1,292 to 1,646 meters)
Mean annual precipitation: 80 to 90 inches (2,032 to 2,286 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 100 days

Map Unit Composition

Haploxerands, volcanic till, cobbly medial sandy loam—75 percent
Minor components—25 percent

Characteristics of Haploxerands, Volcanic Till, Cobbly Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Parent material: Bouldery and loamy till derived from igneous rocks
Observed vegetation: White fir, ponderosa pine, sugar pine, incense cedar, California red fir, California black oak, Sierra chinquapin, greenleaf manzanita, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 5 to 40 percent subangular cobbles, 5 to 60 percent subangular stones, 5 to 60 percent subangular boulders
Depth to a restrictive feature (dense glacial till): 20 to 98 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.5 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; cobbly medial sandy loam
Bw—4 to 17 inches; cobbly medial sandy loam
Bt1—17 to 37 inches; gravelly sandy loam
Bt2—37 to 41 inches; gravelly sandy loam
2Cd1—41 to 52 inches; gravelly, dense glacial till
2Cd2—52 to 80 inches; gravelly, dense glacial till

Minor Components in Map Unit 726

Soils that are 20 to 60 inches deep to bedrock
Composition: 12 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Rock outcrop
Composition: 8 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on mountains
Hydric soil status: Not hydric

Haploxerands, granitic till, and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

727—Bonneyridge sandy loam, 1 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,670 to 4,665 feet (1,119 to 1,423 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 95 to 170 days

Map Unit Composition

Bonneyridge sandy loam—85 percent
Minor components—15 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 1 to 15 percent
Geomorphic position: Ridgetops and flats on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, incense cedar, sugar pine, tanoak, California black oak, whitethorn ceanothus, manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-4
Land capability, nonirrigated: 4e-4
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Minor Components in Map Unit 727

Chawanakee and similar soils
Composition: 5 percent
Slope: 1 to 15 percent
Geomorphic position: Knolls in mountains
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in mountains
Hydric soil status: Hydric

Soils that are 20 to 40 inches deep to bedrock
Composition: 5 percent
Slope: 1 to 15 percent
Geomorphic position: Knolls in mountains
Hydric soil status: Not hydric

728—Bonneyridge sandy loam, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,670 to 4,665 feet (1,119 to 1,423 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 95 to 170 days

Map Unit Composition

Bonneyridge sandy loam—85 percent
Minor components—15 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from quartz diorite
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, incense cedar, sugar pine, tanoak, California black oak, whitethorn ceanothus, manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam

Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Minor Components in Map Unit 728

Soils that are 20 to 40 inches deep to bedrock
Composition: 7 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Aquic Xerofluvents and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in mountains
Hydric soil status: Hydric

729—Bonneyridge sandy loam, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,100 to 4,560 feet (1,250 to 1,390 meters)
Mean annual precipitation: 74 to 77 inches (1,880 to 1,956 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 145 days

Map Unit Composition

Bonneyridge sandy loam—85 percent
Minor components—15 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium derived from quartz diorite
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, incense cedar, sugar pine, tanoak, California black oak, whitethorn ceanothus, manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Minor Components in Map Unit 729

Soils that are 20 to 40 inches deep to bedrock
Composition: 8 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 7 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

730—Tusccoll-Schott complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,600 to 3,395 feet (488 to 1,036 meters)
Mean annual precipitation: 55 to 72 inches (1,397 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 215 days

Map Unit Composition

Tusccoll gravelly loam—60 percent
Schott very gravelly loam—25 percent
Minor components—15 percent

Characteristics of Tusccoll Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, California black oak, canyon live oak, whiteleaf manzanita, California laurel, bigleaf maple, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; gravelly loam
Bt1—6 to 14 inches; gravelly loam
Bt2—14 to 23 inches; gravelly loam
Bt3—23 to 33 inches; gravelly clay loam
Bt4—33 to 41 inches; gravelly clay loam
Bt5—41 to 49 inches; gravelly clay loam
Bt6—49 to 70 inches; gravelly clay loam

Characteristics of Schott Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Gravelly and loamy residuum and/or colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, California black oak, canyon live oak, whiteleaf manzanita, California laurel, bigleaf maple, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 13 inches; very gravelly clay loam
Bt2—13 to 22 inches; very cobbly clay loam
Bt3—22 to 40 inches; extremely gravelly clay loam
Bt4—40 to 50 inches; extremely gravelly sandy clay loam
R—50 inches; bedrock

Minor Components in Map Unit 730

Lydon soils, 20 to 35 percent clay, and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Andic Haploxeralfs with paralithic bedrock at a depth of 20 to 60 inches and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

731—Tusccoll-Schott complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,600 to 3,395 feet (488 to 1,036 meters)
Mean annual precipitation: 55 to 72 inches (1,397 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 215 days

Map Unit Composition

Tusccoll gravelly loam—50 percent
Schott very gravelly loam—35 percent
Minor components—15 percent

Characteristics of Tusccoll Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Fine-loamy colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, California black oak, canyon live oak, whiteleaf manzanita, California laurel, bigleaf maple, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 6 inches; gravelly loam
Bt1—6 to 14 inches; gravelly loam
Bt2—14 to 23 inches; gravelly loam
Bt3—23 to 33 inches; gravelly clay loam
Bt4—33 to 41 inches; gravelly clay loam

Bt5—41 to 49 inches; gravelly clay loam
Bt6—49 to 70 inches; gravelly clay loam

Characteristics of Schott Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Gravelly and loamy residuum and/or colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, California black oak, canyon live oak, whiteleaf manzanita, California laurel, bigleaf maple, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 6 inches; very gravelly loam
Bt1—6 to 13 inches; very gravelly clay loam
Bt2—13 to 22 inches; very cobbly clay loam
Bt3—22 to 40 inches; extremely gravelly clay loam
Bt4—40 to 50 inches; extremely gravelly sandy clay loam
R—50 inches; bedrock

Minor Components in Map Unit 731

Beecee and similar soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Andic Haploxeralfs with paralithic bedrock at a depth of 20 to 60 inches and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Lydon soils, 20 to 35 percent clay, and similar soils
Composition: 3 percent

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

732—Bonepile taxadjunct, 2 to 8 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Homesite development, timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 4,300 to 4,595 feet (1,311 to 1,402 meters)
Mean annual precipitation: 69 to 75 inches (1,753 to 1,905 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 105 to 115 days

Map Unit Composition

Bonepile taxadjunct, duripan substratum—90 percent
Minor components—10 percent

Characteristics of Bonepile Taxadjunct, Duripan Substratum

Slope: 2 to 8 percent
Geomorphic position: Stream terraces in mountains
Parent material: Gravelly alluvium over cemented, gravelly alluvium derived from volcanic rocks
Observed vegetation: Ponderosa pine, incense cedar, Douglas-fir, white fir, California black oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 40 percent medium, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 40 percent subangular stones, 0 to 20 percent subangular boulders
Depth to a restrictive feature (duripan): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Depth to a water table (zone of saturation): 37 to 72 inches
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Moderately well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 4e-3
Land capability, nonirrigated: 4e-3
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 4 inches; gravelly medial sandy loam
A2—4 to 7 inches; very gravelly medial sandy loam
AB—7 to 15 inches; very gravelly medial sandy loam
Bw1—15 to 30 inches; extremely gravelly sandy loam
Bw2—30 to 37 inches; extremely cobbly sandy clay loam
2Bt—37 to 47 inches; extremely gravelly clay loam
2Bqm—47 inches; duripan

Minor Components in Map Unit 732

Xerofluvents and similar soils
Composition: 4 percent
Slope: 0 to 5 percent
Geomorphic position: Flood plains in mountains
Hydric soil status: Not hydric

Soils that are more than 60 inches deep to a duripan
Composition: 4 percent
Slope: 2 to 8 percent
Geomorphic position: Stream terraces in mountains
Hydric soil status: Not hydric

Endoaquolls and similar soils
Composition: 2 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in mountains
Hydric soil status: Hydric

733—Haploxeralfs, terrace, 0 to 5 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Wildlife habitat, homesite development, and watershed
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 400 to 1,400 feet (122 to 427 meters)
Mean annual precipitation: 30 to 55 inches (762 to 1,397 millimeters)
Mean annual air temperature: 55 to 61 degrees F (13 to 16 degrees C)
Frost-free period: 230 to 260 days

Map Unit Composition

Haploxeralfs, terrace, gravelly loam—75 percent
Minor components—25 percent

Characteristics of Haploxeralfs, Terrace, Gravelly Loam

Slope: 0 to 8 percent
Geomorphic position: Stream terraces in canyons

Parent material: Bouldery and loamy alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: Annual grasses and forbs, blue oak, valley oak, live oak, and foothill pine
Texture of the surface layer: Gravelly loam
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, rounded gravel, 0 to 15 percent rounded cobbles, 0 to 5 percent rounded stones, 0 to 5 percent rounded boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups, Terraces
Land capability, irrigated: 3e-7
Land capability, nonirrigated: 3e-7
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
A—0 to 5 inches; gravelly loam
Bt1—5 to 11 inches; gravelly loam
Bt2—11 to 18 inches; very gravelly loam
Bt3—18 to 32 inches; very cobbly clay loam
Bt4—32 to 48 inches; extremely cobbly clay loam
Bt5—48 to 63 inches; extremely cobbly sandy clay loam

Minor Components in Map Unit 733

Xerofluvents and similar soils
Composition: 10 percent
Slope: 0 to 4 percent
Geomorphic position: Flood plains in canyons
Hydric soil status: Not hydric

Haploxeralfs, terrace, nongravelly, and similar soils
Composition: 5 percent
Slope: 0 to 8 percent
Geomorphic position: Stream terraces in canyons
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to bedrock
Composition: 4 percent
Slope: 0 to 8 percent
Geomorphic position: Strath terraces in canyons
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to a duripan
Composition: 3 percent
Slope: 0 to 8 percent
Geomorphic position: Stream terraces in canyons
Hydric soil status: Not hydric

Soils on riser slopes
Composition: 3 percent
Slope: 8 to 35 percent
Geomorphic position: Riser slopes on stream terraces in canyons
Hydric soil status: Not hydric

734—Haploxerands-Aquic Xerofluvents complex, 0 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,195 to 5,200 feet (1,280 to 1,585 meters)
Mean annual precipitation: 76 to 82 inches (1,930 to 2,083 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 90 to 130 days

Map Unit Composition

Haploxerands medial sandy loam—55 percent
Aquic Xerofluvents peaty very fine sandy loam—35 percent
Minor components—10 percent

Characteristics of Haploxerands Medial Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: Terraces in mountain valleys
Parent material: Sandy and gravelly alluvium derived from igneous rocks
Observed vegetation: White fir, sugar pine, California red fir, ponderosa pine, incense cedar, California black oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent coarse, subrounded gravel, 0 to 15 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 118 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A1—0.5 inch to 2 inches; medial sandy loam

A2—2 to 5 inches; gravelly medial sandy loam
Bw1—5 to 12 inches; medial sandy loam
Bw2—12 to 23 inches; gravelly medial sandy loam
Bw3—23 to 30 inches; gravelly coarse sandy loam
Bw4—30 to 42 inches; gravelly coarse sandy loam
Bw5—42 to 60 inches; gravelly coarse sandy loam
Bw6—60 to 80 inches; coarse sandy loam

Characteristics of Aquic Xerofluvents Peaty Very Fine Sandy Loam

Slope: 0 to 8 percent
Geomorphic position: Meadows in mountain valleys
Parent material: Stratified, sandy alluvium derived from quartz diorite
Observed vegetation: Carex, *Juncus*, annual grasses and forbs, willows, and alders
Texture of the surface layer: Peaty very fine sandy loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Frequent
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 17 inches
Available water capacity: Moderate (about 7.3 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; peaty very fine sandy loam
A2—3 to 7 inches; mucky fine sandy loam
C—7 to 16 inches; gravelly coarse sandy loam
Ab—16 to 19 inches; mucky fine sandy loam
C´—19 to 23 inches; gravelly sandy loam
A´b—23 to 35 inches; mucky very fine sandy loam
C´´—35 to 49 inches; gravelly loamy coarse sand
A´´b—49 to 63 inches; peaty fine sandy loam
C´´´—63 to 71 inches; gravelly loamy coarse sand
A´´´b—71 to 80 inches; mucky fine sandy loam

Minor Components in Map Unit 734

Haploxerands skeletal and similar soils
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: Terraces in mountain valleys
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to dense glacial till
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: Terraces in mountain valleys
Hydric soil status: Not hydric

Bonneyridge sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 15 percent
Geomorphic position: Footslopes in mountain valleys
Hydric soil status: Not hydric

Soils on riser slopes
Composition: 2 percent
Slope: 15 to 35 percent
Geomorphic position: Riser slopes on terraces in mountain valleys
Hydric soil status: Not hydric

735—Fluvaquents, loamy, 0 to 3 percent slopes

Map Unit Setting

General location: Central Butte County
Major uses: Livestock grazing, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 2,155 feet (610 to 658 meters)
Mean annual precipitation: 55 to 57 inches (1,397 to 1,448 millimeters)
Mean annual air temperature: 55 degrees F (13 degrees C)
Frost-free period: 210 to 230 days

Map Unit Composition

Fluvaquents loam—80 percent
Minor components—20 percent

Characteristics of Fluvaquents Loam

Slope: 0 to 3 percent
Geomorphic position: Stream terraces in mountain valleys
Parent material: Stratified, sandy and silty alluvium derived from igneous and metamorphic rocks
Observed vegetation: Annual grasses and forbs, ponderosa pine, California black oak, white alder, willows, bigleaf maple, blackberry, and *Carex*
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None
Depth to a water table (zone of saturation): 10 to 40 inches
Available water capacity: High (about 10.0 inches)
Natural drainage class: Somewhat poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A1—0.5 inch to 2 inches; loam
A2—2 to 9 inches; loam
Bw1—9 to 18 inches; sandy clay loam
Bw2—18 to 24 inches; silt loam
C1—24 to 27 inches; sandy loam
C2—27 to 37 inches; silt loam
Agb1—37 to 45 inches; loam
Agb2—45 to 65 inches; sandy clay loam
Agb3—65 to 70 inches; sandy clay loam
Agb3—65 to 70 inches; sandy loam
2Cg—70 to 85 inches; sandy clay loam

Minor Components in Map Unit 735

Fluvaquents, gravelly, and similar soils
Composition: 10 percent
Slope: 0 to 3 percent
Geomorphic position: Terraces in mountain valleys
Hydric soil status: Hydric

Xerofluvents and similar soils
Composition: 5 percent
Slope: 0 to 3 percent
Geomorphic position: Flood plains in mountain valleys
Hydric soil status: Not hydric

Islandbar and similar soils
Composition: 3 percent
Slope: 0 to 3 percent
Geomorphic position: Footslopes in mountain valleys
Hydric soil status: Not hydric

Featherfalls sandy loam and similar soils
Composition: 2 percent
Slope: 0 to 3 percent
Geomorphic position: Footslopes in mountain valleys
Hydric soil status: Not hydric

801—Obstruction gravelly sandy loam, 3 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,835 to 5,360 feet (1,170 to 1,634 meters)
Mean annual precipitation: 67 to 78 inches (1,702 to 1,981 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 100 to 175 days

Map Unit Composition

Obstruction gravelly sandy loam—70 percent
Minor components—30 percent

Characteristics of Obstruction Gravelly Sandy Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Parent material: Fine-loamy residuum over coarse-loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent fine, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 96 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 4 inches; slightly decomposed plant material
A—4 to 7 inches; gravelly sandy loam
Bt1—7 to 10 inches; gravelly sandy clay loam
Bt2—10 to 18 inches; gravelly fine sandy loam
Bt3—18 to 25 inches; gravelly sandy clay loam
Bt4—25 to 33 inches; sandy clay loam
Bt5—33 to 44 inches; fine sandy loam
Bt6—44 to 64 inches; gravelly fine sandy loam
Bt7—64 to 84 inches; gravelly fine sandy loam
Cr—84 inches; bedrock

Minor Components in Map Unit 801

Coarse-loamy soils
Composition: 12 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Obskel and similar soils
Composition: 10 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 5 percent
Slope: 3 to 15 percent

Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Retsongulch and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

802—Obskel-Obstruction complex, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,995 to 5,320 feet (914 to 1,622 meters)
Mean annual precipitation: 66 to 78 inches (1,676 to 1,981 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 100 to 175 days

Map Unit Composition

Obskel very gravelly sandy loam—40 percent
Obstruction gravelly sandy loam—40 percent
Minor components—20 percent

Characteristics of Obskel Very Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Gravelly, coarse-loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 35 percent medium, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile

Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 4 inches; very gravelly sandy loam
Bt1—4 to 9 inches; very gravelly sandy loam
Bt2—9 to 19 inches; very gravelly sandy loam
Bt3—19 to 30 inches; very gravelly loam
Bt4—30 to 56 inches; very gravelly loam
Cr—56 inches; bedrock

Characteristics of Obstruction Gravelly Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Fine-loamy over coarse-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent fine, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 96 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)

Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups

Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile

Oi—0 to 4 inches; slightly decomposed plant material
A—4 to 7 inches; gravelly sandy loam
Bt1—7 to 10 inches; gravelly sandy clay loam
Bt2—10 to 18 inches; gravelly fine sandy loam
Bt3—18 to 25 inches; gravelly sandy clay loam
Bt4—25 to 33 inches; sandy clay loam
Bt5—33 to 44 inches; fine sandy loam
Bt6—44 to 64 inches; gravelly fine sandy loam
Bt7—64 to 84 inches; gravelly fine sandy loam
Cr—84 inches; bedrock

Minor Components in Map Unit 802

Coarse-loamy soils

Composition: 12 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Retsongulch and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

803—Obskel-Obstruction complex, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,795 to 5,360 feet (853 to 1,634 meters)
Mean annual precipitation: 66 to 78 inches (1,676 to 1,981 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 100 to 175 days

Map Unit Composition

Obskel very gravelly sandy loam—40 percent
Obstruction gravelly sandy loam—40 percent
Minor components—20 percent

Characteristics of Obskel Very Gravelly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Parent material: Gravelly, coarse-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 35 percent medium, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1

Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 4 inches; very gravelly sandy loam
Bt1—4 to 9 inches; very gravelly sandy loam
Bt2—9 to 19 inches; very gravelly sandy loam
Bt3—19 to 30 inches; very gravelly loam
Bt4—30 to 56 inches; very gravelly loam
Cr—56 inches; bedrock

Characteristics of Obstruction Gravelly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Parent material: Fine-loamy over coarse-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, tanoak, whitethorn ceanothus, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent fine, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 96 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 4 inches; slightly decomposed plant material
A—4 to 7 inches; gravelly sandy loam
Bt1—7 to 10 inches; gravelly sandy clay loam
Bt2—10 to 18 inches; gravelly fine sandy loam
Bt3—18 to 25 inches; gravelly sandy clay loam
Bt4—25 to 33 inches; sandy clay loam
Bt5—33 to 44 inches; fine sandy loam
Bt6—44 to 64 inches; gravelly fine sandy loam
Bt7—64 to 84 inches; gravelly fine sandy loam
Cr—84 inches; bedrock

Minor Components in Map Unit 803

Coarse-loamy soils
Composition: 12 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Retsongulch and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

804—Obskel-Obstruction-Retsongulch complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Watershed, wildlife habitat, and timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,795 to 5,515 feet (853 to 1,682 meters)
Mean annual precipitation: 66 to 78 inches (1,676 to 1,981 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 175 days

Map Unit Composition

Obskel very gravelly sandy loam—35 percent
Obstruction gravelly sandy loam—25 percent
Retsongulch very gravelly sandy loam—20 percent
Minor components—20 percent

Characteristics of Obskel Very Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Gravelly, coarse-loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, Douglas-fir, California black oak, canyon live oak, incense cedar, sugar pine, whiteleaf manzanita, deerbrush, and dogwood

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 35 percent medium, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 4 inches; very gravelly sandy loam
Bt1—4 to 9 inches; very gravelly sandy loam
Bt2—9 to 19 inches; very gravelly sandy loam
Bt3—19 to 30 inches; very gravelly loam
Bt4—30 to 56 inches; very gravelly loam
Cr—56 inches; bedrock

Characteristics of Obstruction Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Fine-loamy over coarse-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, Douglas-fir, California black oak, canyon live oak, incense cedar, sugar pine, whiteleaf manzanita, deerbrush, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent fine, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 96 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 4 inches; slightly decomposed plant material
A—4 to 7 inches; gravelly sandy loam
Bt1—7 to 10 inches; gravelly sandy clay loam
Bt2—10 to 18 inches; gravelly fine sandy loam
Bt3—18 to 25 inches; gravelly sandy clay loam
Bt4—25 to 33 inches; sandy clay loam
Bt5—33 to 44 inches; fine sandy loam
Bt6—44 to 64 inches; gravelly fine sandy loam
Bt7—64 to 84 inches; gravelly fine sandy loam
Cr—84 inches; bedrock

Characteristics of Retsongulch Very Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Gravelly residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Canyon live oak, ponderosa pine, tanoak, Douglas-fir, California black oak, incense cedar, sugar pine, whiteleaf manzanita, deerbrush, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 80 percent medium, subangular gravel, 0 to 15 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly sandy loam
Bt1—3 to 12 inches; very gravelly sandy clay loam
Bt2—12 to 21 inches; extremely gravelly sandy clay loam
Bt3—21 to 30 inches; extremely gravelly sandy loam
R—30 inches; bedrock

Minor Components in Map Unit 804

Coarse-loamy soils
Composition: 12 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Flumewall and similar soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

805—Bottlehill-Walkermine-Logtrain complex, 3 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,995 to 5,275 feet (1,219 to 1,609 meters)
Mean annual precipitation: 73 to 76 inches (1,854 to 1,930 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 100 to 140 days

Map Unit Composition

Bottlehill very gravelly loam—50 percent
Walkermine very gravelly loam—20 percent
Logtrain gravelly loam—20 percent
Minor components—10 percent

Characteristics of Bottlehill Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Parent material: Gravelly and loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-4
Land capability, nonirrigated: 4e-4
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam
A2—4 to 9 inches; very gravelly loam
Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Walkermine Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Parent material: Gravelly and loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 75 percent coarse, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 4 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt—3 to 12 inches; very gravelly loam
R—12 inches; bedrock

Characteristics of Logtrain Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains

Parent material: Gravelly and loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 21 inches; very gravelly loam
Bt3—21 to 38 inches; very cobbly loam
Bt4—38 to 54 inches; extremely gravelly loam
R—54 inches; bedrock

Minor Components in Map Unit 805

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

806—Bottlehill-Walkermine-Logtrain complex, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,995 to 5,200 feet (1,219 to 1,585 meters)
Mean annual precipitation: 73 to 76 inches (1,854 to 1,930 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Bottlehill very gravelly loam—50 percent
Walkermine very gravelly loam—20 percent
Logtrain gravelly loam—20 percent
Minor components—10 percent

Characteristics of Bottlehill Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam
A2—4 to 9 inches; very gravelly loam

Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Walkermine Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 75 percent coarse, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 4 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt—3 to 12 inches; very gravelly loam
R—12 inches; bedrock

Characteristics of Logtrain Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, incense cedar, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 21 inches; very gravelly loam
Bt3—21 to 38 inches; very cobbly loam
Bt4—38 to 54 inches; extremely gravelly loam
R—54 inches; bedrock

Minor Components in Map Unit 806

Rock outcrop
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

807—Bottlehill-Logtrain-Walkermine complex, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,995 to 5,200 feet (914 to 1,585 meters)
Mean annual precipitation: 68 to 76 inches (1,727 to 1,930 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Bottlehill very gravelly loam—35 percent
Logtrain gravelly loam—30 percent
Walkermine very gravelly loam—25 percent
Minor components—10 percent

Characteristics of Bottlehill Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic mountains
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam
A2—4 to 9 inches; very gravelly loam
Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Logtrain Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic mountains
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons and on metamorphic mountains
Hydric soil status: Not hydric

808—Bottlehill-Walkermine-Logtrain complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,995 to 5,275 feet (914 to 1,609 meters)
Mean annual precipitation: 68 to 76 inches (1,727 to 1,930 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Bottlehill very gravelly loam—45 percent
Walkermine very gravelly loam—20 percent
Logtrain gravelly loam—20 percent
Minor components—15 percent

Characteristics of Bottlehill Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam

Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Walkermine Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy residuum and/or colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 75 percent coarse, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 4 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8

Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt—3 to 12 inches; very gravelly loam
R—12 inches; bedrock

Characteristics of Logtrain Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 21 inches; very gravelly loam
Bt3—21 to 38 inches; very cobbly loam
Bt4—38 to 54 inches; extremely gravelly loam
R—54 inches; bedrock

Minor Components in Map Unit 808

Rock outcrop
Composition: 8 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Scree
Composition: 3 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

809—Walkermine-Bottlehill-Logtrain-Rock outcrop complex, 70 to 110 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,595 to 5,155 feet (792 to 1,572 meters)
Mean annual precipitation: 72 to 74 inches (1,829 to 1,880 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Walkermine very gravelly loam—45 percent
Bottlehill very gravelly loam—15 percent
Logtrain gravelly loam—15 percent
Rock outcrop (metavolcanic)—15 percent
Minor components—10 percent

Characteristics of Walkermine Very Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 75 percent coarse, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 4 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt—3 to 12 inches; very gravelly loam
R—12 inches; bedrock

Characteristics of Bottlehill Very Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 35 to 75 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A1—2 to 4 inches; very gravelly loam
A2—4 to 9 inches; very gravelly loam
Bt1—9 to 13 inches; very gravelly loam
Bt2—13 to 22 inches; very gravelly loam
Bt3—22 to 33 inches; extremely gravelly clay loam
R—33 inches; bedrock

Characteristics of Logtrain Gravelly Loam

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons

Parent material: Gravelly and loamy colluvium derived from metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, incense cedar, sugar pine, canyon live oak, tanoak, California black oak, white fir, dwarf tanoak, greenleaf manzanita, Sierra chinquapin, and prostrate ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 50 percent medium, subangular gravel, 0 to 30 percent subangular cobbles, 0 to 20 percent subangular stones, 0 to 10 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 5.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 9 inches; very gravelly loam
Bt2—9 to 21 inches; very gravelly loam
Bt3—21 to 38 inches; very cobbly loam
Bt4—38 to 54 inches; extremely gravelly loam
R—54 inches; bedrock

Characteristics of Rock Outcrop (Metavolcanic)

Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 809

Scree
Composition: 5 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Haploxerults with bedrock at a depth of more than 60 inches and similar soils
Composition: 3 percent
Slope: 70 to 110 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 70 to 110 percent

Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

810—Dixmine-Mac-Spine complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra mountains
Elevation: 2,195 to 3,795 feet (670 to 1,158 meters)
Mean annual precipitation: 64 to 73 inches (1,626 to 1,854 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 200 days

Map Unit Composition

Dixmine very gravelly loam—35 percent
Mac gravelly loam—25 percent
Spine very gravelly loam—25 percent
Minor components—15 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Gravelly, loamy and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material

A—2 to 6 inches; very gravelly loam
Bt1—6 to 11 inches; very gravelly loam
Bt2—11 to 17 inches; gravelly loam
Bt3—17 to 30 inches; very cobbly clay loam
Bt4—30 to 41 inches; very gravelly clay loam
Bt5—41 to 54 inches; extremely cobbly clay loam
Cr—54 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent medium gravel, 0 to 10 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Gravelly colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 20 to 60 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Minor Components in Map Unit 810

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Haploxerults, loamy-skeletal, more than 60 inches deep to bedrock, and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Soils that are 2 to 10 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Soils that formed in hydraulic mining debris
Composition: 1 percent
Slope: 2 to 30 percent
Geomorphic position: The bottom of canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

811—Powellton-Toadtown complex, 3 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,120 to 4,235 feet (951 to 1,292 meters)
Mean annual precipitation: 65 to 75 inches (1,651 to 1,905 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Powellton gravelly loam—50 percent
Toadtown loam—40 percent
Minor components—10 percent

Characteristics of Powellton Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Parent material: Fine-loamy residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, whitevein shinleaf, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.3 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 15 inches; loam
Bt3—15 to 24 inches; clay loam
Bt4—24 to 30 inches; clay loam
Bt5—30 to 41 inches; silt loam
Bt6—41 to 61 inches; loam
Bt7—61 to 83 inches; loam

Characteristics of Toadtown Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Parent material: Clayey residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, whitevein shinleaf, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 5 inches; loam
Bt1—5 to 8 inches; loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 18 inches; clay
Bt4—18 to 27 inches; clay
Bt5—27 to 51 inches; clay loam

Bt6—51 to 65 inches; loam
Bt7—65 to 75 inches; loam
Crt—75 to 79 inches; loam

Minor Components in Map Unit 811

Dixmine and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Endoaquolls loam and similar soils
Composition: 2 percent
Slope: 0 to 8 percent
Geomorphic position: Meadows in mountains
Hydric soil status: Hydric

Obstruction and similar soils
Composition: 2 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metamorphic mountains
Hydric soil status: Not hydric

812—Powellton-Toadtown complex, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,880 to 4,280 feet (878 to 1,305 meters)
Mean annual precipitation: 65 to 75 inches (1,651 to 1,905 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Powellton gravelly loam—50 percent
Toadtown loam—40 percent
Minor components—10 percent

Characteristics of Powellton Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, whitevein shinleaf, and dogwood

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 15 inches; loam
Bt3—15 to 24 inches; clay loam
Bt4—24 to 30 inches; clay loam
Bt5—30 to 41 inches; silt loam
Bt6—41 to 61 inches; loam
Bt7—61 to 83 inches; loam

Characteristics of Toadtown Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Parent material: Clayey colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, whitevein shinleaf, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile

Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 5 inches; loam
Bt1—5 to 8 inches; loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 18 inches; clay
Bt4—18 to 27 inches; clay
Bt5—27 to 51 inches; clay loam
Bt6—51 to 65 inches; loam
Bt7—65 to 75 inches; loam
Crt—75 to 79 inches; loam

Minor Components in Map Unit 812

Dixmine and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Obstruction and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

Mac and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and side slopes on metamorphic mountains
Hydric soil status: Not hydric

813—Powellton-Toadtown complex, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,555 to 4,080 feet (780 to 1,244 meters)
Mean annual precipitation: 70 to 75 inches (1,778 to 1,905 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Powellton gravelly loam—50 percent
Toadtown loam—40 percent
Minor components—10 percent

Characteristics of Powellton Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in ravines and on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, California black oak, whitevein shinleaf, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 inch to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 15 inches; loam
Bt3—15 to 24 inches; clay loam
Bt4—24 to 30 inches; clay loam
Bt5—30 to 41 inches; silt loam
Bt6—41 to 61 inches; loam
Bt7—61 to 83 inches; loam

Characteristics of Toadtown Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in ravines and on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: Ponderosa pine, tanoak, sugar pine, Douglas-fir, incense cedar, white fir, California black oak, whitevein shinleaf, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 35 percent fine, subangular gravel, 0 to 5 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 120 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.1 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A—3 to 5 inches; loam
Bt1—5 to 8 inches; loam
Bt2—8 to 13 inches; clay loam
Bt3—13 to 18 inches; clay
Bt4—18 to 27 inches; clay
Bt5—27 to 51 inches; clay loam
Bt6—51 to 65 inches; loam
Bt7—65 to 75 inches; loam
Crt—75 to 79 inches; loam

Minor Components in Map Unit 813

Dixmine and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in ravines and on metamorphic mountains
Hydric soil status: Not hydric

Mac and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in ravines and on metamorphic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in ravines and on metamorphic mountains
Hydric soil status: Not hydric

814—Mountyana gravelly loam, 2 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,355 to 4,395 feet (719 to 1,341 meters)
Mean annual precipitation: 60 to 74 inches (1,524 to 1,880 millimeters)
Mean annual air temperature: 50 to 55 degrees F (10 to 13 degrees C)
Frost-free period: 110 to 210 days

Map Unit Composition

Mountyana gravelly loam—80 percent
Minor components—20 percent

Characteristics of Mountyana Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Fine-loamy residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, Douglas-fir, sugar pine, white fir, incense cedar, California black oak, tanoak, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 13 inches; gravelly clay loam
Bt3—13 to 19 inches; gravelly clay loam
Bt4—19 to 26 inches; gravelly clay loam
Bt5—26 to 37 inches; gravelly clay loam
Bt/Cr—37 to 52 inches; extremely gravelly clay loam
Cr/Bt—52 to 65 inches; extremely gravelly loam
Cr—65 inches; bedrock

Minor Components in Map Unit 814

Schott and similar soils
Composition: 9 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

815—Mountyana gravelly loam, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,155 to 4,235 feet (658 to 1,292 meters)
Mean annual precipitation: 60 to 74 inches (1,524 to 1,880 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 115 to 210 days

Map Unit Composition

Mountyana gravelly loam—80 percent
Minor components—20 percent

Characteristics of Mountyana Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Fine-loamy residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, Douglas-fir, sugar pine, white fir, incense cedar, California black oak, tanoak, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent medium, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile

Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly loam
Bt2—9 to 13 inches; gravelly clay loam
Bt3—13 to 19 inches; gravelly clay loam
Bt4—19 to 26 inches; gravelly clay loam
Bt5—26 to 37 inches; gravelly clay loam
Bt/Cr—37 to 52 inches; extremely gravelly clay loam
Cr/Bt—52 to 65 inches; extremely gravelly loam
Cr—65 inches; bedrock

Minor Components in Map Unit 815

Schott and similar soils
Composition: 9 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Paradiso and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

817—Lydon very gravelly medial coarse sandy loam, 2 to 15 percent slopes

Map Unit Setting

General location: Northern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 3,375 to 4,700 feet (1,030 to 1,433 meters)
Mean annual precipitation: 70 to 72 inches (1,778 to 1,829 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 110 to 165 days

Map Unit Composition

Lydon very gravelly medial coarse sandy loam—80 percent
Minor components—20 percent

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Sandy and gravelly residuum weathered from volcanic breccia
Observed vegetation: California black oak, ponderosa pine, Douglas-fir, incense cedar, canyon live oak, tanoak, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 3 inches; very gravelly medial coarse sandy loam
Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
Bw2—6 to 13 inches; extremely gravelly sandy loam
Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Minor Components in Map Unit 817

Schott and similar soils
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to lithic bedrock
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Mountyana and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

818—Lydon very gravelly medial coarse sandy loam, 15 to 30 percent slopes

Map Unit Setting

General location: Northern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,595 to 4,675 feet (792 to 1,426 meters)
Mean annual precipitation: 60 to 72 inches (1,524 to 1,829 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 125 to 215 days

Map Unit Composition

Lydon very gravelly medial coarse sandy loam—75 percent
Minor components—25 percent

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Parent material: Sandy and gravelly colluvium and/or residuum weathered from volcanic breccia
Observed vegetation: California black oak, ponderosa pine, Douglas-fir, incense cedar, canyon live oak, tanoak, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 3 inches; very gravelly medial coarse sandy loam
Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
Bw2—6 to 13 inches; extremely gravelly sandy loam
Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Minor Components in Map Unit 818

Soils that are less than 20 inches deep to lithic bedrock
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Schott and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

Mountyana and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: The top and shoulder slopes of volcanic ridges
Hydric soil status: Not hydric

819—Lydon-Rock outcrop complex, 30 to 50 percent slopes

Map Unit Setting

General location: Northern Butte County
Major uses: Wildlife habitat, watershed, and timber production
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,040 to 4,795 feet (622 to 1,463 meters)
Mean annual precipitation: 55 to 72 inches (1,397 to 1,829 millimeters)

Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 120 to 230 days

Map Unit Composition

Lydon very gravelly medial coarse sandy loam—65 percent
Rock outcrop (mudflow breccia)—20 percent
Minor components—15 percent

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Parent material: Sandy and gravelly colluvium derived from volcanic breccia
Observed vegetation: Tanoak, Douglas-fir, California black oak, ponderosa pine, incense cedar, canyon live oak, manzanita, Pacific poison oak, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 3 inches; very gravelly medial coarse sandy loam
Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
Bw2—6 to 13 inches; extremely gravelly sandy loam
Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Characteristics of Rock Outcrop (Mudflow Breccia)

Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 819

Soils that are less than 20 inches deep to lithic bedrock
Composition: 8 percent
Slope: 30 to 50 percent

Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes in canyons
Hydric soil status: Not hydric

820—Lydon-Rock outcrop complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,495 to 6,085 feet (761 to 1,856 meters)
Mean annual precipitation: 67 to 72 inches (1,702 to 1,829 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 110 to 185 days

Map Unit Composition

Lydon very gravelly medial coarse sandy loam—60 percent
Rock outcrop (mudflow breccia)—25 percent
Minor components—15 percent

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Sandy and gravelly colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, white fir, California black oak, tanoak, canyon live oak, ponderosa pine, incense cedar, manzanita, Pacific poison oak, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 3 inches; very gravelly medial coarse sandy loam
Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
Bw2—6 to 13 inches; extremely gravelly sandy loam
Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Characteristics of Rock Outcrop (Mudflow Breccia)

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 820

Soils that are less than 20 inches deep to lithic bedrock
Composition: 10 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

821—Lydon-Rock outcrop complex, 70 to 100 percent slopes

Map Unit Setting

General location: Northern Butte County
Major uses: Wildlife habitat and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,595 to 3,720 feet (792 to 1,134 meters)
Mean annual precipitation: 68 to 74 inches (1,727 to 1,880 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Lydon very gravelly medial coarse sandy loam—55 percent
Rock outcrop (mudflow breccia)—30 percent
Minor components—15 percent

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Parent material: Sandy and gravelly colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, white fir, California black oak, tanoak, canyon live oak, ponderosa pine, incense cedar, manzanita, Pacific poison oak, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 0.9 inch)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 8
- *Land capability, nonirrigated:* 8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 0.5 inch; slightly decomposed plant material
- Oe—0.5 to 1 inch; moderately decomposed plant material
- A—1 to 3 inches; very gravelly medial coarse sandy loam
- Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
- Bw2—6 to 13 inches; extremely gravelly sandy loam

Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Characteristics of Rock Outcrop (Mudflow Breccia)

Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Minor Components in Map Unit 821

Soils that are less than 20 inches deep to lithic bedrock
Composition: 12 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 1 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Redbone and similar soils
Composition: 1 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 1 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

822—Bonepile gravelly medial loam, 2 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 3,595 to 5,360 feet (1,097 to 1,634 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Bonepile gravelly medial loam—85 percent
Minor components—15 percent

Characteristics of Bonepile Gravelly Medial Loam

Slope: 2 to 15 percent
Geomorphic position: The top and toeslopes of volcanic ridges

Parent material: Loamy tephra over gravelly and loamy residuum weathered from volcanic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, greenleaf manzanita, Sierra chinquapin, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent medium, subangular gravel, 0 to 35 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; gravelly medial loam
A2—3 to 9 inches; cobbly medial loam
Bw1—9 to 18 inches; gravelly medial loam
Bw2—18 to 30 inches; very gravelly medial loam
2Bw3—30 to 44 inches; very gravelly medial loam
2Cr—44 inches; bedrock

Minor Components in Map Unit 822

Soils that are less than 40 inches deep to paralithic bedrock
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: The top and toeslopes of volcanic ridges
Hydric soil status: Not hydric

Soils that are more than 60 inches deep to bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: The top and toeslopes of volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top and toeslopes of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 2 to 15 percent

Geomorphic position: The top and toeslopes of volcanic ridges
Hydric soil status: Not hydric

823—Bonepile gravelly medial loam, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 3,320 to 5,655 feet (1,012 to 1,725 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 48 to 52 degrees F (9 to 11 degrees C)
Frost-free period: 100 to 145 days

Map Unit Composition

Bonepile gravelly medial loam—85 percent
Minor components—15 percent

Characteristics of Bonepile Gravelly Medial Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Loamy tephra over gravelly and loamy colluvium and/or residuum weathered from volcanic rocks
Observed vegetation: Ponderosa pine, white fir, sugar pine, Douglas-fir, California black oak, greenleaf manzanita, Sierra chinquapin, and whitethorn ceanothus
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 35 percent medium, subangular gravel, 0 to 35 percent subangular cobbles, 0 to 30 percent subangular stones, 0 to 30 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A1—1 to 3 inches; gravelly medial loam
- A2—3 to 9 inches; cobbly medial loam
- Bw1—9 to 18 inches; gravelly medial loam
- Bw2—18 to 30 inches; very gravelly medial loam

2Bw3—30 to 44 inches; very gravelly medial loam
2Cr—44 inches; bedrock

Minor Components in Map Unit 823

Soils that are less than 40 inches deep to paralithic bedrock
Composition: 7 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Soils that are more than 60 inches deep to bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

824—Beecee very gravelly medial loam, 30 to 50 percent slopes

Map Unit Setting

General location: Northeastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,315 to 5,655 feet (707 to 1,725 meters)
Mean annual precipitation: 66 to 80 inches (1,676 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 95 to 200 days

Map Unit Composition

Beecee very gravelly medial loam—85 percent
Minor components—15 percent

Characteristics of Beecee Very Gravelly Medial Loam

Slope: 30 to 50 percent
Geomorphic position: Backslopes on volcanic ridges and in canyons
Parent material: Tephra-influenced, gravelly and loamy colluvium derived from volcanic rocks over gravelly and stony, loamy residuum weathered from volcanic breccia
Observed vegetation: Douglas-fir, white fir, California black oak, incense cedar, ponderosa pine, sugar pine, tanoak, canyon live oak, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 10 percent subrounded boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 4 inches; very gravelly medial loam
Bt1—4 to 8 inches; very gravelly medial loam
Bt2—8 to 15 inches; very gravelly medial loam
Bt3—15 to 22 inches; extremely gravelly medial loam
Bt4—22 to 31 inches; extremely gravelly loam
Bt5—31 to 44 inches; very gravelly loam
2Bt6—44 to 59 inches; very gravelly loam
2Bt7—59 to 68 inches; very gravelly loam
2Bt8—68 to 86 inches; very stony loam

Minor Components in Map Unit 824

Lydon and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on volcanic ridges and in canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on volcanic ridges and in canyons
Hydric soil status: Not hydric

Soils that are less than 20 inches deep to bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on volcanic ridges and in canyons
Hydric soil status: Not hydric

Extremely bouldery soils
Composition: 2 percent
Slope: 15 to 50 percent
Geomorphic position: Backslopes on volcanic ridges and in canyons
Hydric soil status: Not hydric

825—Beecee-Lydon complex, 50 to 70 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 2,315 to 5,875 feet (707 to 1,792 meters)
Mean annual precipitation: 66 to 80 inches (1,676 to 2,032 millimeters)
Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 95 to 200 days

Map Unit Composition

Beecee very gravelly medial loam—60 percent
Lydon very gravelly medial coarse sandy loam—20 percent
Minor components—20 percent

Characteristics of Beecee Very Gravelly Medial Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Tephra-influenced, gravelly and loamy colluvium derived from volcanic rocks over gravelly and stony, loamy residuum weathered from volcanic breccia
Observed vegetation: Douglas-fir, white fir, California black oak, incense cedar, ponderosa pine, sugar pine, tanoak, canyon live oak, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 15 to 40 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 10 percent subrounded boulders
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 3.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7e-1
- *Land capability, nonirrigated:* 7e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 0.5 inch; slightly decomposed plant material
- Oe—0.5 to 1 inch; moderately decomposed plant material
- A—1 to 4 inches; very gravelly medial loam
- Bt1—4 to 8 inches; very gravelly medial loam
- Bt2—8 to 15 inches; very gravelly medial loam
- Bt3—15 to 22 inches; extremely gravelly medial loam
- Bt4—22 to 31 inches; extremely gravelly loam
- Bt5—31 to 44 inches; very gravelly loam
- 2Bt6—44 to 59 inches; very gravelly loam

2Bt7—59 to 68 inches; very gravelly loam
2Bt8—68 to 86 inches; very stony loam

Characteristics of Lydon Very Gravelly Medial Coarse Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Parent material: Sandy and gravelly colluvium derived from volcanic breccia
Observed vegetation: Douglas-fir, white fir, California black oak, tanoak, canyon live oak, ponderosa pine, incense cedar, manzanita, Pacific poison oak, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 50 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
Oe—0.5 to 1 inch; moderately decomposed plant material
A—1 to 3 inches; very gravelly medial coarse sandy loam
Bw1—3 to 6 inches; very gravelly medial coarse sandy loam
Bw2—6 to 13 inches; extremely gravelly sandy loam
Bw3—13 to 21 inches; extremely gravelly sandy loam
Bw4—21 to 35 inches; extremely cobbly fine sandy loam
R—35 inches; bedrock

Minor Components in Map Unit 825

Soils that are less than 20 inches deep to bedrock
Composition: 8 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Schott and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in ravines and in canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

Extremely bouldery soils
Composition: 2 percent
Slope: 15 to 70 percent
Geomorphic position: Footslopes in ravines and canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 1 percent
Slope: 150 to 175 percent
Geomorphic position: Backslopes in ravines and canyons
Hydric soil status: Not hydric

826—Redbone gravelly medial sandy loam, 3 to 15 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 3,795 to 5,200 feet (1,158 to 1,585 meters)
Mean annual precipitation: 70 to 75 inches (1,778 to 1,905 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 100 to 140 days

Map Unit Composition

Redbone gravelly medial sandy loam—80 percent
Minor components—20 percent

Characteristics of Redbone Gravelly Medial Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Loamy tephra over gravelly and loamy residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, dogwood, common snowberry, Sierra chinquapin, greenleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 35 percent medium, subrounded gravel, 0 to 15 percent subrounded cobbles, 0 to 10 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly medial sandy loam
Bt1—4 to 7 inches; gravelly medial sandy loam
Bt2—7 to 17 inches; gravelly medial fine sandy loam
Bt3—17 to 28 inches; very gravelly fine sandy loam
Bt4—28 to 41 inches; very gravelly coarse sandy loam
Bt5—41 to 54 inches; very gravelly coarse sandy loam
Cr—54 inches; bedrock

Minor Components in Map Unit 826

Soils that are more than 60 inches deep to bedrock
Composition: 6 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Mountyana and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Soils that are less than 40 inches deep to bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Very bouldery soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

827—Redbone gravelly medial sandy loam, 15 to 30 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22B

Landscape: Southern Cascade Mountains
Elevation: 3,795 to 4,995 feet (1,158 to 1,524 meters)
Mean annual precipitation: 70 to 75 inches (1,778 to 1,905 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 100 to 140 days

Map Unit Composition

Redbone gravelly medial sandy loam—80 percent
Minor components—20 percent

Characteristics of Redbone Gravelly Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Loamy tephra over gravelly and loamy colluvium and/or residuum weathered from volcanic breccia
Observed vegetation: Ponderosa pine, white fir, Douglas-fir, sugar pine, incense cedar, California black oak, dogwood, common snowberry, Sierra chinquapin, greenleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 35 percent medium, subrounded gravel, 0 to 15 percent subrounded cobbles, 0 to 10 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 4 inches; gravelly medial sandy loam
Bt1—4 to 7 inches; gravelly medial sandy loam
Bt2—7 to 17 inches; gravelly medial fine sandy loam
Bt3—17 to 28 inches; very gravelly fine sandy loam
Bt4—28 to 41 inches; very gravelly coarse sandy loam
Bt5—41 to 54 inches; very gravelly coarse sandy loam
Cr—54 inches; bedrock

Minor Components in Map Unit 827

Soils that are less than 40 inches deep to bedrock
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Mountyana and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lydon and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Soils that are more than 60 inches deep to bedrock
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Very bouldery soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

829—Paradiso loam, 2 to 15 percent slopes

Map Unit Setting

General location: North-central Butte county
Major uses: Timber production, homesite and commercial development, wildlife habitat, and watershed
Major land resource area: 22B
Landscape: Southern Cascade Mountains
Elevation: 1,220 to 3,730 feet (372 to 1,137 meters)
Mean annual precipitation: 35 to 73 inches (889 to 1,854 millimeters)
Mean annual air temperature: 54 to 59 degrees F (12 to 15 degrees C)
Frost-free period: 145 to 255 days

Map Unit Composition

Paradiso loam—80 percent
Minor components—20 percent

Characteristics of Paradiso Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Clayey residuum weathered from volcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, California black oak, incense cedar, tanoak, sugar pine, Scotch broom, deerbrush, and whiteleaf manzanita; some white fir at the higher elevations
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; loam
ABt—4 to 9 inches; clay loam
Bt1—9 to 16 inches; clay loam
Bt2—16 to 25 inches; clay loam
Bt3—25 to 45 inches; clay
Bt4—45 to 58 inches; clay loam
Bt5—58 to 74 inches; clay loam
2Bt6—74 to 84 inches; loam

Minor Components in Map Unit 829

Mountyana and similar soils
Composition: 8 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Schott and similar soils
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Soils that have a water table at a depth of 30 to 80 inches
Composition: 3 percent
Slope: 2 to 8 percent
Geomorphic position: Areas along streams on the top of volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Areas of post rock basalt flow on the top of volcanic ridges
Hydric soil status: Not hydric

830—Paradiso loam, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte county
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22B

Landscape: Southern Cascade Mountains
Elevation: 1,295 to 3,680 feet (396 to 1,122 meters)
Mean annual precipitation: 35 to 73 inches (889 to 1,854 millimeters)
Mean annual air temperature: 54 to 59 degrees F (12 to 15 degrees C)
Frost-free period: 145 to 255 days

Map Unit Composition

Paradiso loam—75 percent
Minor components—25 percent

Characteristics of Paradiso Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Clayey colluvium and/or residuum weathered from volcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, California black oak, incense cedar, tanoak, sugar pine, Scotch broom, deerbrush, and whiteleaf manzanita; some white fir at the higher elevations
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent fine, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; loam
ABt—4 to 9 inches; clay loam
Bt1—9 to 16 inches; clay loam
Bt2—16 to 25 inches; clay loam
Bt3—25 to 45 inches; clay
Bt4—45 to 58 inches; clay loam
Bt5—58 to 74 inches; clay loam
2Bt6—74 to 84 inches; loam

Minor Components in Map Unit 830

Mountyana and similar soils
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Schott and similar soils
Composition: 10 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Soils that have a water table at a depth of 30 to 80 inches
Composition: 3 percent
Slope: 2 to 8 percent
Geomorphic position: Areas along streams on volcanic ridges
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

831—Surnuf-Bigridge-Spine complex, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Homesite development, timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,595 to 3,395 feet (792 to 1,036 meters)
Mean annual precipitation: 67 to 70 inches (1,702 to 1,778 millimeters)
Mean annual air temperature: 54 degrees F (12 degrees C)
Frost-free period: 165 to 180 days

Map Unit Composition

Surnuf gravelly loam—40 percent
Bigridge loam—30 percent
Spine very gravelly loam—15 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Parent material: Silty and clayey residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Bigridge Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Parent material: Fine-loamy residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, deerbrush, and whiteleaf manzanita
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Parent material: Gravelly and loamy residuum weathered from metavolcanic rocks
Observed vegetation: Whiteleaf manzanita, ponderosa pine, tanoak, Douglas-fir, sugar pine, canyon live oak, incense cedar, and black oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Minor Components in Map Unit 831

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 5 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 3 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 2 percent
Slope: 3 to 15 percent

Geomorphic position: Ridgetops and footslopes on metavolcanic mountains
Hydric soil status: Not hydric

832—Surnuf-Bigridge-Spine complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, watershed, and homesite development
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,555 to 3,395 feet (780 to 1,036 meters)
Mean annual precipitation: 65 to 70 inches (1,651 to 1,778 millimeters)
Mean annual air temperature: 54 degrees F (12 degrees C)
Frost-free period: 165 to 180 days

Map Unit Composition

Surnuf gravelly loam—40 percent
Bigridge loam—30 percent
Spine very gravelly loam—15 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Silty and clayey colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam

Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Bigridge Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, deerbrush, and whiteleaf manzanita
Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Gravelly and loamy residuum weathered from metavolcanic rocks
Observed vegetation: Whiteleaf manzanita, ponderosa pine, tanoak, Douglas-fir, sugar pine, canyon live oak, incense cedar, and California black oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Minor Components in Map Unit 832

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

833—Surnuf-Bigridge-Spine complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains

Elevation: 2,200 to 3,395 feet (671 to 1,036 meters)
Mean annual precipitation: 60 to 70 inches (1,524 to 1,778 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 165 to 210 days

Map Unit Composition

Surnuf gravelly loam—60 percent
Bigridge loam—15 percent
Spine very gravelly loam—15 percent
Minor components—10 percent

Characteristics of Surnuf Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 2 percent subangular stones, 0 to 2 percent subangular boulders
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; gravelly clay loam
Bt2—9 to 16 inches; gravelly clay loam
Bt3—16 to 27 inches; gravelly clay
Bt4—27 to 29 inches; gravelly clay
Bt5—29 to 56 inches; gravelly silty clay
Bt6—56 to 72 inches; silty clay

Characteristics of Bigridge Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Fine-loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, California black oak, incense cedar, sugar pine, deerbrush, and whiteleaf manzanita

Texture of the surface layer: Moderately decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 30 percent coarse, angular gravel, 0 to 5 percent angular cobbles, 0 to 5 percent angular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oe—0 to 1 inch; moderately decomposed plant material
A—1 to 5 inches; loam
BAt—5 to 9 inches; gravelly loam
Bt1—9 to 15 inches; gravelly loam
Bt2—15 to 20 inches; gravelly loam
BCt1—20 to 27 inches; very gravelly loam
BCt2—27 to 36 inches; extremely gravelly loam
BCt3—36 to 51 inches; very gravelly loam
Crt—51 to 62 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Parent material: Gravelly and loamy colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Whiteleaf manzanita, ponderosa pine, tanoak, Douglas-fir, sugar pine, canyon live oak, incense cedar, and California black oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8

Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Minor Components in Map Unit 833

Ultic Haploxeralfs, fine-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Ultic Haploxeralfs, loamy-skeletal, and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Minniecreek and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

834—Hietanen-Mac complex, 3 to 15 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 3,995 feet (975 to 1,219 meters)
Mean annual precipitation: 65 to 72 inches (1,651 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 185 days

Map Unit Composition

Hietanen gravelly loam—50 percent
Mac gravelly loam—30 percent
Minor components—20 percent

Characteristics of Hietanen Gravelly Loam

Slope: 3 to 15 percent

Geomorphic position: Ridgetops on metasedimentary mountains
Parent material: Silty residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, sugar pine, white fir, incense cedar, California black oak, whiteleaf manzanita, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 8 inches; gravelly loam
Bt2—8 to 19 inches; silt loam
Bt3—19 to 30 inches; silt loam
Bt4—30 to 53 inches; silt loam
Cr—53 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Parent material: Silty residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, sugar pine, white fir, incense cedar, California black oak, whiteleaf manzanita, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Minor Components in Map Unit 834

Jocal and similar soils
Composition: 8 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Dixmine and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Spine and similar soils
Composition: 4 percent
Slope: 3 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

835—Hietanen-Mac complex, 15 to 30 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,795 to 3,995 feet (853 to 1,219 meters)
Mean annual precipitation: 65 to 72 inches (1,651 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 185 days

Map Unit Composition

Hietanen gravelly loam—60 percent
Mac gravelly loam—20 percent
Minor components—20 percent

Characteristics of Hietanen Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, sugar pine, white fir, incense cedar, California black oak, whiteleaf manzanita, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 8 inches; gravelly loam
Bt2—8 to 19 inches; silt loam
Bt3—19 to 30 inches; silt loam
Bt4—30 to 53 inches; silt loam
Cr—53 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Parent material: Silty residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, tanoak, sugar pine, white fir, incense cedar, California black oak, whiteleaf manzanita, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Minor Components in Map Unit 835

Jocal and similar soils
Composition: 8 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Hydric soil status: Not hydric

Dixmine and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Hydric soil status: Not hydric

Spine and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Ridgetops and shoulder slopes on metasedimentary mountains
Hydric soil status: Not hydric

836—Hietanen-Mac-Spine complex, 30 to 50 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 3,995 feet (975 to 1,219 meters)
Mean annual precipitation: 64 to 72 inches (1,626 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 185 days

Map Unit Composition

Hietanen gravelly loam—50 percent

Mac gravelly loam—20 percent
Spine very gravelly loam—15 percent
Minor components—15 percent

Characteristics of Hietanen Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 8 inches; gravelly loam
Bt2—8 to 19 inches; silt loam
Bt3—19 to 30 inches; silt loam
Bt4—30 to 53 inches; silt loam
Cr—53 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Nose slopes on metasedimentary mountains
Parent material: Gravelly residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Minor Components in Map Unit 836

Jocal and similar soils
Composition: 8 percent

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 80 inches deep to bedrock
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

837—Hietanen-Spine-Mac complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central and southeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,995 to 3,720 feet (609 to 1,134 meters)
Mean annual precipitation: 64 to 72 inches (1,626 to 1,829 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 185 days

Map Unit Composition

Hietanen gravelly loam—35 percent
Spine very gravelly loam—25 percent
Mac gravelly loam—20 percent
Minor components—20 percent

Characteristics of Hietanen Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, Pacific madrone, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.2 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
Bt1—3 to 8 inches; gravelly loam
Bt2—8 to 19 inches; silt loam
Bt3—19 to 30 inches; silt loam
Bt4—30 to 53 inches; silt loam
Cr—53 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Nose slopes on metasedimentary mountains
Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains

Parent material: Silty colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Tanoak, Douglas-fir, sugar pine, white fir, ponderosa pine, California black oak, incense cedar, dogwood, whiteleaf manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Minor Components in Map Unit 837

Jocal and similar soils
Composition: 8 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 80 inches deep to bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Haploxerults, coarse-loamy, more than 60 inches deep to bedrock, and similar soils
Composition: 3 percent
Slope: 50 to 70 percent

Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

838—Dixmine-Spine-Mac complex, 50 to 70 percent slopes

Map Unit Setting

General location: North-central Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 1,600 to 3,595 feet (488 to 1,097 meters)
Mean annual precipitation: 64 to 73 inches (1,626 to 1,854 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 200 days

Map Unit Composition

Dixmine very gravelly loam—35 percent
Spine very gravelly loam—25 percent
Mac gravelly loam—25 percent
Minor components—15 percent

Characteristics of Dixmine Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Gravelly, loamy and clayey residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 25 percent medium, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 10 percent subangular stones
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.2 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material

A—2 to 6 inches; very gravelly loam
Bt1—6 to 11 inches; very gravelly loam
Bt2—11 to 17 inches; gravelly loam
Bt3—17 to 30 inches; very cobbly clay loam
Bt4—30 to 41 inches; very gravelly clay loam
Bt5—41 to 54 inches; extremely cobbly clay loam
Cr—54 inches; bedrock

Characteristics of Spine Very Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Nose slopes in canyons
Parent material: Gravelly colluvium and/or residuum weathered from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 20 to 60 percent medium, subangular gravel, 0 to 20 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.9 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-8
Land capability, nonirrigated: 7e-8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; very gravelly loam
Bt1—3 to 9 inches; extremely gravelly loam
Bt2—9 to 16 inches; extremely gravelly clay loam
R—16 inches; bedrock

Characteristics of Mac Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Parent material: Fine-loamy residuum and/or colluvium derived from metavolcanic rocks
Observed vegetation: Douglas-fir, tanoak, California black oak, canyon live oak, ponderosa pine, sugar pine, bigleaf maple, incense cedar, manzanita, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 50 percent medium gravel, 0 to 10 percent cobbles, 0 to 5 percent stones

Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 9 inches; very gravelly loam
Bt2—9 to 15 inches; gravelly silty clay loam
Bt3—15 to 23 inches; silty clay loam
Crt—23 to 37 inches; extremely gravelly silt loam
Cr—37 inches; bedrock

Minor Components in Map Unit 838

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Rock outcrop
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Nose slopes in canyons
Hydric soil status: Not hydric

Haploxerults, loamy-skeletal, more than 60 inches deep to bedrock, and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Soils that are 2 to 10 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Nose slopes in canyons
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Beecee and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes in canyons
Hydric soil status: Not hydric

Hydraulic mining debris
Composition: 1 percent
Slope: 2 to 30 percent
Geomorphic position: The bottom of canyons
Hydric soil status: Not hydric

839—Chawanakee-Billscabin complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,795 to 4,595 feet (1,158 to 1,402 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Chawanakee gravelly sandy loam—55 percent
Billscabin gravelly sandy loam—35 percent
Minor components—10 percent

Characteristics of Chawanakee Gravelly Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Coarse-loamy residuum weathered from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)

Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: C

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oe—1 to 2 inches; moderately decomposed plant material
A—2 to 5 inches; gravelly sandy loam
Bw1—5 to 11 inches; gravelly sandy loam
Bw2—11 to 19 inches; gravelly sandy loam
Cr—19 inches; bedrock

Characteristics of Billscabin Gravelly Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Gravelly, coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 65 percent coarse, angular gravel, 0 to 50 percent angular cobbles, 0 to 50 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 82 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; gravelly sandy loam
A2—5 to 14 inches; very gravelly sandy loam
Bw—14 to 27 inches; very gravelly sandy loam
C1—27 to 37 inches; very gravelly loamy sand
C2—37 to 57 inches; very gravelly loamy sand
C3—57 to 82 inches; very gravelly loamy sand

Minor Components in Map Unit 839

Rock outcrop
Composition: 5 percent

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 10 to 20 inches deep to lithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

841—Billscabin-Bonneyridge complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,100 to 4,595 feet (945 to 1,402 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Billscabin gravelly sandy loam—50 percent
Bonneyridge sandy loam—35 percent
Minor components—15 percent

Characteristics of Billscabin Gravelly Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Gravelly, coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 65 percent coarse, angular gravel, 0 to 50 percent angular cobbles, 0 to 50 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 82 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)

Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; gravelly sandy loam
A2—5 to 14 inches; very gravelly sandy loam
Bw—14 to 27 inches; very gravelly sandy loam
C1—27 to 37 inches; very gravelly loamy sand
C2—37 to 57 inches; very gravelly loamy sand
C3—57 to 82 inches; very gravelly loamy sand

Characteristics of Bonneyridge Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy residuum and/or colluvium derived from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Minor Components in Map Unit 841

Lewisflat and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Nose slopes on granitic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are 40 to 60 inches deep to bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

842—Billscabin-Bonneyridge complex, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,100 to 4,595 feet (945 to 1,402 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Billscabin gravelly sandy loam—60 percent
Bonneyridge sandy loam—25 percent
Minor components—15 percent

Characteristics of Billscabin Gravelly Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Gravelly, coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 65 percent coarse, angular gravel, 0 to 50 percent angular cobbles, 0 to 50 percent angular stones, 0 to 10 percent angular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 82 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.3 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 5 inches; gravelly sandy loam
A2—5 to 14 inches; very gravelly sandy loam
Bw—14 to 27 inches; very gravelly sandy loam
C1—27 to 37 inches; very gravelly loamy sand
C2—37 to 57 inches; very gravelly loamy sand
C3—57 to 82 inches; very gravelly loamy sand

Characteristics of Bonneyridge Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy residuum and/or colluvium derived from quartz diorite
Observed vegetation: White fir, Douglas-fir, sugar pine, ponderosa pine, incense cedar, whitethorn ceanothus, dogwood, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)

Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8

Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

846—Bonneyridge-Lewisflat complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Bonneyridge sandy loam—60 percent
Lewisflat loam—20 percent
Minor components—20 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Parent material: Coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Low (about 4.9 inches)
- *Natural drainage class:* Somewhat excessively drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A1—1 to 3 inches; sandy loam
- A2—3 to 6 inches; sandy loam
- Bw1—6 to 16 inches; coarse sandy loam
- Bw2—16 to 22 inches; coarse sandy loam
- Bw3—22 to 31 inches; coarse sandy loam
- Bw4—31 to 39 inches; sandy loam

C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Lewisflat Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 5 inches; loam
A2—5 to 9 inches; loam
Bt1—9 to 18 inches; loam
2Bt2—18 to 33 inches; loam
2Bt3—33 to 49 inches; loam
2BCt1—49 to 65 inches; loam
2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 846

Chawanakee and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay in the subsoil, and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and footslopes on granitic mountains
Hydric soil status: Not hydric

847—Bonneyridge-Lewisflat complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Bonneyridge sandy loam—60 percent
Lewisflat loam—20 percent
Minor components—20 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1

Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Lewisflat Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 5 inches; loam
A2—5 to 9 inches; loam
Bt1—9 to 18 inches; loam
2Bt2—18 to 33 inches; loam
2Bt3—33 to 49 inches; loam
2BCt1—49 to 65 inches; loam
2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 847

Chawanakee and similar soils
Composition: 5 percent
Slope: 15 to 30 percent

Geomorphic position: Nose slopes on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay in the subsoil, and similar soils
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are less than 40 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Eroded soils from which the O horizon and the upper part of the A horizon have been removed
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

848—Bonneyridge-Lewisflat complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Bonneyridge sandy loam—60 percent

Lewisflat loam—20 percent
Minor components—20 percent

Characteristics of Bonneyridge Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Coarse-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.9 inches)
Natural drainage class: Somewhat excessively drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: A

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; sandy loam
A2—3 to 6 inches; sandy loam
Bw1—6 to 16 inches; coarse sandy loam
Bw2—16 to 22 inches; coarse sandy loam
Bw3—22 to 31 inches; coarse sandy loam
Bw4—31 to 39 inches; sandy loam
C1—39 to 56 inches; loamy coarse sand
C2—56 to 76 inches; gravelly loamy coarse sand

Characteristics of Lewisflat Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Ponderosa pine, sugar pine, white fir, incense cedar, Douglas-fir, California black oak, tanoak, whitethorn ceanothus, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 5 inches; loam
A2—5 to 9 inches; loam
Bt1—9 to 18 inches; loam
2Bt2—18 to 33 inches; loam
2Bt3—33 to 49 inches; loam
2BCt1—49 to 65 inches; loam
2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 848

Chawanakee and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay in the subsoil, and similar soils
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Rock outcrop
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Coarse-loamy soils that are less than 40 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Eroded soils from which the O horizon and the upper part of the A horizon have been removed
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

850—Lewisflat loam, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Lewisflat loam—85 percent
Minor components—15 percent

Characteristics of Lewisflat Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Parent material: Fine-loamy residuum weathered from quartz diorite
Observed vegetation: Douglas-fir, white fir, sugar pine, ponderosa pine, incense cedar, California black oak, tanoak, Pacific madrone, whiteleaf manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 5 inches; loam
A2—5 to 9 inches; loam
Bt1—9 to 18 inches; loam
2Bt2—18 to 33 inches; loam

2Bt3—33 to 49 inches; loam
2BCt1—49 to 65 inches; loam
2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 850

Bonneyridge sandy loam and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that have more than 27 percent clay in the subsoil
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that have more than 35 percent rock fragments
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay, and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on granitic mountains
Hydric soil status: Not hydric

851—Lewisflat loam, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Lewisflat loam—80 percent
Minor components—20 percent

Characteristics of Lewisflat Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Douglas-fir, white fir, sugar pine, ponderosa pine, incense cedar, California black oak, tanoak, Pacific madrone, whiteleaf manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 8.7 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 3 inches; slightly decomposed plant material
- A1—3 to 5 inches; loam
- A2—5 to 9 inches; loam
- Bt1—9 to 18 inches; loam
- 2Bt2—18 to 33 inches; loam
- 2Bt3—33 to 49 inches; loam
- 2BCt1—49 to 65 inches; loam
- 2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 851

Bonneyridge sandy loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that have more than 27 percent clay in the subsoil
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to lithic bedrock
Composition: 3 percent

Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that have more than 35 percent rock fragments
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay, and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

852—Lewisflat loam, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,595 feet (1,006 to 1,402 meters)
Mean annual precipitation: 70 to 80 inches (1,778 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Lewisflat loam—75 percent
Minor components—25 percent

Characteristics of Lewisflat Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from quartz diorite
Observed vegetation: Douglas-fir, white fir, sugar pine, ponderosa pine, incense cedar, California black oak, tanoak, Pacific madrone, whiteleaf manzanita, and dogwood
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 60 to 130 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.7 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 5 inches; loam
A2—5 to 9 inches; loam
Bt1—9 to 18 inches; loam
2Bt2—18 to 33 inches; loam
2Bt3—33 to 49 inches; loam
2BCt1—49 to 65 inches; loam
2BCt2—65 to 75 inches; loam

Minor Components in Map Unit 852

Rock outcrop
Composition: 9 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Chawanakee and similar soils
Composition: 6 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that have more than 35 percent rock fragments
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Bonneyridge sandy loam and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

Haplohumults, 27 to 35 percent clay, and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on granitic mountains
Hydric soil status: Not hydric

860—Toadtown-Powellton complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,995 to 4,370 feet (914 to 1,333 meters)
Mean annual precipitation: 60 to 75 inches (1,524 to 1,905 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Toadtown gravelly loam—60 percent
Powellton silt loam—20 percent
Minor components—20 percent

Characteristics of Toadtown Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Parent material: Clayey residuum weathered from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 2 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 9.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A—1 to 6 inches; gravelly loam
- Bt1—6 to 15 inches; silty clay loam
- Bt2—15 to 32 inches; silty clay
- Bt3—32 to 43 inches; silty clay
- Bt4—43 to 55 inches; cobbly silty clay loam
- Bt5—55 to 80 inches; silty clay loam

Characteristics of Powellton Silt Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Parent material: Fine-loamy residuum weathered from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent cobbles, 0 to 15 percent gravel

Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; silt loam
A2—3 to 9 inches; silt loam
Bt1—9 to 19 inches; silty clay loam
Bt2—19 to 28 inches; silty clay loam
Bt3—28 to 33 inches; silty clay loam
Bt4—33 to 48 inches; silt loam
Bt5—48 to 66 inches; silt loam
BC—66 to 73 inches; loam
C1—73 to 83 inches; loam
C2—83 to 109 inches; loam

Minor Components in Map Unit 860

Palexerults, mesic, and similar soils
Composition: 7 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Rogerville and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Sites taxadjunct and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent

Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Typic Haploxerults and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Soils that have a mechanically altered surface layer
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

861—Toadtown-Powellton complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,480 to 4,370 feet (756 to 1,333 meters)
Mean annual precipitation: 60 to 75 inches (1,524 to 1,905 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Toadtown gravelly loam—60 percent
Powellton silt loam—20 percent
Minor components—20 percent

Characteristics of Toadtown Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Parent material: Clayey residuum and/or colluvium derived from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 2 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: High (about 9.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 6 inches; gravelly loam
Bt1—6 to 15 inches; silty clay loam
Bt2—15 to 32 inches; silty clay
Bt3—32 to 43 inches; silty clay
Bt4—43 to 55 inches; cobbly silty clay loam
Bt5—55 to 80 inches; silty clay loam

Characteristics of Powellton Silt Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Parent material: Fine-loamy residuum and/or colluvium derived from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent cobbles, 0 to 15 percent gravel
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; silt loam
A2—3 to 9 inches; silt loam
Bt1—9 to 19 inches; silty clay loam
Bt2—19 to 28 inches; silty clay loam
Bt3—28 to 33 inches; silty clay loam

Bt4—33 to 48 inches; silt loam
Bt5—48 to 66 inches; silt loam
BC—66 to 73 inches; loam
C1—73 to 83 inches; loam
C2—83 to 109 inches; loam

Minor Components in Map Unit 861

Palexerults, mesic, and similar soils
Composition: 7 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Rogerville and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Sites taxadjunct and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Typic Haploxerults and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Soils that are fine-loamy in the upper part and clayey-skeletal in the lower part
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Soils that have a mechanically altered surface layer
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

862—Toadtown-Powellton complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,575 to 4,370 feet (785 to 1,333 meters)
Mean annual precipitation: 60 to 75 inches (1,524 to 1,905 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Toadtown gravelly loam—60 percent
Powellton silt loam—20 percent
Minor components—20 percent

Characteristics of Toadtown Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Parent material: Clayey residuum and/or colluvium derived from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 2 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 9.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A—1 to 6 inches; gravelly loam
- Bt1—6 to 15 inches; silty clay loam
- Bt2—15 to 32 inches; silty clay
- Bt3—32 to 43 inches; silty clay
- Bt4—43 to 55 inches; cobbly silty clay loam
- Bt5—55 to 80 inches; silty clay loam

Characteristics of Powellton Silt Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Parent material: Fine-loamy residuum and/or colluvium derived from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent cobbles, 0 to 15 percent gravel
Restrictive feature: None identified
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very high (about 10.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A1—1 to 3 inches; silt loam
A2—3 to 9 inches; silt loam
Bt1—9 to 19 inches; silty clay loam
Bt2—19 to 28 inches; silty clay loam
Bt3—28 to 33 inches; silty clay loam
Bt4—33 to 48 inches; silt loam
Bt5—48 to 66 inches; silt loam
BC—66 to 73 inches; loam
C1—73 to 83 inches; loam
C2—83 to 109 inches; loam

Minor Components in Map Unit 862

Palexerults, mesic, and similar soils
Composition: 7 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Rogerville and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Sites taxadjunct and similar soils
Composition: 4 percent
Slope: 30 to 50 percent

Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Soils that have a mechanically altered surface layer
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

863—Toadtown-Powellton complex, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,480 to 3,995 feet (756 to 1,219 meters)
Mean annual precipitation: 60 to 75 inches (1,524 to 1,905 millimeters)
Mean annual air temperature: 52 to 55 degrees F (11 to 13 degrees C)
Frost-free period: 140 to 180 days

Map Unit Composition

Toadtown gravelly loam—60 percent
Powellton silt loam—20 percent
Minor components—20 percent

Characteristics of Toadtown Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Parent material: Clayey residuum and/or colluvium derived from igneous and metamorphic rocks
Observed vegetation: Douglas-fir, ponderosa pine, sugar pine, white fir, tanoak, incense cedar, California black oak, Pacific madrone, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 2 percent subangular cobbles
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: High (about 9.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups

C1—73 to 83 inches; loam
C2—83 to 109 inches; loam

Minor Components in Map Unit 863

Palexerults, mesic, and similar soils
Composition: 7 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Rogerville and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Sites taxadjunct and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Typic Haploxerults and similar soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Soils that are loamy-skeletal in the upper part and fine textured in the lower part
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

880—Sites-Jocal taxadjuncts, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,870 to 4,320 feet (876 to 1,318 meters)
Mean annual precipitation: 60 to 80 inches (1,524 to 2,030 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 130 to 180 days

Map Unit Composition

Sites taxadjunct gravelly loam—50 percent
Jocal taxadjunct gravelly loam—35 percent
Minor components—15 percent

Characteristics of Sites Taxadjunct Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Parent material: Silty and clayey residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, Pacific madrone, incense cedar, sugar pine, tanoak, California black oak, white fir, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
BA—3 to 10 inches; very gravelly loam
Bt1—10 to 21 inches; gravelly silty clay
Bt2—21 to 34 inches; gravelly silty clay
Bt3—34 to 59 inches; silty clay
Bt4—59 to 72 inches; silty clay

Characteristics of Jocal Taxadjunct Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Parent material: Fine-loamy residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, Pacific madrone, incense cedar, sugar pine, tanoak, California black oak, white fir, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material

Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A—3 to 4 inches; gravelly loam
Bw—4 to 9 inches; gravelly loam
Bt1—9 to 19 inches; gravelly loam
Bt2—19 to 33 inches; gravelly loam
Bt3—33 to 46 inches; very gravelly clay loam
BCt—46 to 52 inches; extremely gravelly clay loam
Cr—52 to 68 inches; bedrock

Minor Components in Map Unit 880

Rogerville and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Palexerults, mesic, and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Mac gravelly loam and similar soils
Composition: 2 percent
Slope: 2 to 15 percent

Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

881—Sites-Jocal taxadjuncts, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,595 to 4,195 feet (792 to 1,280 meters)
Mean annual precipitation: 60 to 80 inches (1,524 to 2,030 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 130 to 180 days

Map Unit Composition

Sites taxadjunct gravelly loam—50 percent
Jocal taxadjunct gravelly loam—35 percent
Minor components—15 percent

Characteristics of Sites Taxadjunct Gravelly Loam

Slope: 15 to 30 percent

883—Sites-Jocal taxadjuncts, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, watershed, and wildlife habitat
Major land resource area: 22A

Landscape: Northern Sierra Nevada Mountains
Elevation: 2,700 to 3,700 feet (823 to 1,128 meters)
Mean annual precipitation: 60 to 80 inches (1,524 to 2,030 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 130 to 180 days

Map Unit Composition

Sites taxadjunct gravelly loam—50 percent
Jocal taxadjunct gravelly loam—40 percent
Minor components—10 percent

Characteristics of Sites Taxadjunct Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metasedimentary mountains
Parent material: Silty and clayey colluvium and/or residuum weathered from metasedimentary rocks
Observed vegetation: Ponderosa pine, Douglas-fir, Pacific madrone, incense cedar, sugar pine, tanoak, California black oak, white fir, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 7.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 3 inches; gravelly loam
BA—3 to 10 inches; very gravelly loam
Bt1—10 to 21 inches; gravelly silty clay
Bt2—21 to 34 inches; gravelly silty clay
Bt3—34 to 59 inches; silty clay
Bt4—59 to 72 inches; silty clay

Characteristics of Jocal Taxadjunct Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metasedimentary mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metasedimentary rocks

Observed vegetation: Ponderosa pine, Douglas-fir, Pacific madrone, incense cedar, sugar pine, tanoak, California black oak, white fir, deerbrush, and Pacific poison oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 15 percent coarse, subangular gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A—3 to 4 inches; gravelly loam
Bw—4 to 9 inches; gravelly loam
Bt1—9 to 19 inches; gravelly loam
Bt2—19 to 33 inches; gravelly loam
Bt3—33 to 46 inches; very gravelly clay loam
BCt—46 to 52 inches; extremely gravelly clay loam
Cr—52 to 68 inches; bedrock

Minor Components in Map Unit 883

Mac gravelly loam and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metasedimentary mountains
Hydric soil status: Not hydric

Palexerults, mesic, and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are 20 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine-loamy soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 50 to 70 percent

Geomorphic position: Backslopes on metasedimentary mountains
Hydric soil status: Not hydric

885—Rogerville silt loam, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,195 feet (1,006 to 1,280 meters)
Mean annual precipitation: 65 to 80 inches (1,651 to 2,032 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Rogerville silt loam—75 percent
Minor components—25 percent

Characteristics of Rogerville Silt Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Parent material: Silty and clayey residuum weathered from ultramafic rocks
Observed vegetation: Douglas-fir, sugar pine, ponderosa pine, white fir, tanoak, Pacific madrone, California black oak, incense cedar, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 7 inches; silt loam
- Bt1—7 to 13 inches; silty clay loam
- Bt2—13 to 24 inches; silty clay
- Bt3—24 to 34 inches; gravelly silty clay loam
- Bt4—34 to 42 inches; gravelly clay loam
- Bt5—42 to 51 inches; extremely gravelly clay loam
- Cr—51 to 55 inches; bedrock

Minor Components in Map Unit 885

Sites taxadjunct loam and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Soils that are fine-silty in the upper part and clayey in the lower part
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Fine textured soils that are more than 60 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Soils that are fine-loamy in the upper part and clayey in the lower part
Composition: 4 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Soils that overlie peridotite or serpentine bedrock (lithic)
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Soils that have andic material on the surface
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Soils that have a mechanically altered surface layer
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on ultramafic mountains
Hydric soil status: Not hydric

Toadtown and similar soils
Composition: 1 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

Powellton and similar soils
Composition: 1 percent
Slope: 2 to 15 percent

Geomorphic position: Ridgetops on intrusive igneous and metamorphic mountains
Hydric soil status: Not hydric

886—Rogerville silt loam, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,195 feet (1,006 to 1,280 meters)
Mean annual precipitation: 65 to 80 inches (1,651 to 2,032 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Rogerville silt loam—80 percent
Minor components—20 percent

Characteristics of Rogerville Silt Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from ultramafic rocks
Observed vegetation: Douglas-fir, sugar pine, ponderosa pine, white fir, tanoak, Pacific madrone, California black oak, incense cedar, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 7 inches; silt loam
- Bt1—7 to 13 inches; silty clay loam
- Bt2—13 to 24 inches; silty clay
- Bt3—24 to 34 inches; gravelly silty clay loam
- Bt4—34 to 42 inches; gravelly clay loam

Bt5—42 to 51 inches; extremely gravelly clay loam
Cr—51 to 55 inches; bedrock

Minor Components in Map Unit 886

Soils that are fine-silty in the upper part and clayey in the lower part
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that are fine-loamy in the upper part and clayey in the lower part
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Sites taxadjunct gravelly loam and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are more than 60 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that overlie peridotite or serpentine bedrock (lithic)
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Clayey-skeletal soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that have andic material on the surface
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that have a mechanically altered surface layer
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that have a thick A horizon and are on north-facing slopes
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

892—Rogerville silt loam, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,195 feet (1,006 to 1,280 meters)
Mean annual precipitation: 65 to 80 inches (1,651 to 2,032 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Rogerville silt loam—85 percent
Minor components—15 percent

Characteristics of Rogerville Silt Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from ultramafic rocks
Observed vegetation: Douglas-fir, sugar pine, ponderosa pine, white fir, tanoak, Pacific madrone, California black oak, incense cedar, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 6.3 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 7e-1
- *Land capability, nonirrigated:* 7e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A—2 to 7 inches; silt loam
- Bt1—7 to 13 inches; silty clay loam
- Bt2—13 to 24 inches; silty clay
- Bt3—24 to 34 inches; gravelly silty clay loam
- Bt4—34 to 42 inches; gravelly clay loam
- Bt5—42 to 51 inches; extremely gravelly clay loam
- Cr—51 to 55 inches; bedrock

Minor Components in Map Unit 892

Sites taxadjunct gravelly loam and similar soils
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are more than 60 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that are fine-loamy in the upper part and clayey in the lower part
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

893—Rogerville silt loam, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,300 to 4,195 feet (1,006 to 1,280 meters)
Mean annual precipitation: 65 to 80 inches (1,651 to 2,032 millimeters)
Mean annual air temperature: 52 to 54 degrees F (11 to 12 degrees C)
Frost-free period: 140 to 170 days

Map Unit Composition

Rogerville silt loam—85 percent
Minor components—15 percent

Characteristics of Rogerville Silt Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Silty and clayey residuum and/or colluvium derived from ultramafic rocks
Observed vegetation: Douglas-fir, sugar pine, ponderosa pine, white fir, tanoak, Pacific madrone, California black oak, incense cedar, manzanita, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 7 inches; silt loam
Bt1—7 to 13 inches; silty clay loam
Bt2—13 to 24 inches; silty clay
Bt3—24 to 34 inches; gravelly silty clay loam
Bt4—34 to 42 inches; gravelly clay loam
Bt5—42 to 51 inches; extremely gravelly clay loam
Cr—51 to 55 inches; bedrock

Minor Components in Map Unit 893

Sites taxadjunct gravelly loam and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Fine textured soils that are more than 60 inches deep to paralithic bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Fine-loamy soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Soils that are fine-loamy in the upper part and clayey in the lower part
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

902—Lava flows-Lumpkin complex, 0 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Source of aggregate, wildlife habitat, and watershed
Major land resource area: 22A

Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 5,200 feet (975 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Lava flows (Lovejoy basalt)—50 percent
Lumpkin gravelly medial sandy loam—40 percent
Minor components—10 percent

Characteristics of Lava Flows (Lovejoy Basalt)

Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Surface runoff (bare conditions): Very high
Definition: Lava flows consist of exposed basalt formed from lateral surficial outpouring of molten lava from a vent or fissure (fig. 27).

Characteristics of Lumpkin Gravelly Medial Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum weathered from basalt
Observed vegetation: Scattered ponderosa pine, incense cedar, California black oak, manzanita, and annual grasses and forbs
Texture of the surface layer: Gravelly medial sandy loam
Percentage of the surface covered by rock fragments: 10 to 80 percent coarse gravel, 2 to 20 percent cobbles, 0 to 5 percent stones

Figure 27.—An area of Lava flows. Fall River Canyon is in the background; Shake Ridge is on the left, and Lumpkin Ridge is on the right.

Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly medial sandy loam
Bw1—3 to 8 inches; extremely gravelly medial fine sandy loam
Bw2—8 to 14 inches; extremely cobbly medial sandy loam
R—14 inches; bedrock

Minor Components in Map Unit 902

Escarpments
Composition: 3 percent
Slope: 15 to 100 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Medial-skeletal soils that are less than 10 inches deep to lithic bedrock
Composition: 2 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Pits
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Lavatop and similar soils
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Timberisland and similar soils
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Springs and riparian areas
Composition: 1 percent
Slope: 0 to 15 percent

Geomorphic position: The top of basalt ridges
Hydric soil status: Hydric

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

903—Mudwash-Timberisland-Lavatop complex, 2 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 5,200 feet (975 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 46 to 52 degrees F (8 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Mudwash gravelly medial sandy loam—45 percent
Timberisland very gravelly medial sandy loam—25 percent
Lavatop gravelly medial fine sandy loam—20 percent
Minor components—10 percent

Characteristics of Mudwash Gravelly Medial Sandy Loam

Slope: 2 to 30 percent
Geomorphic position: Concave areas on the top and side slopes of basalt ridges
Parent material: Mixed tephra over gravelly colluvium and/or residuum weathered from basalt
Observed vegetation: White fir, incense cedar, ponderosa pine, sugar pine, whitethorn ceanothus, deerbrush, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1

Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oa—1 to 4 inches; moderately decomposed plant material
A1—4 to 8 inches; gravelly medial sandy loam
A2—8 to 13 inches; gravelly medial sandy loam
Bw—13 to 26 inches; gravelly medial sandy loam
2Bt1—26 to 35 inches; gravelly loam
2Bt2—35 to 52 inches; gravelly loam
2BCt—52 to 72 inches; extremely gravelly loam
2Cr—72 to 89 inches; bedrock

Characteristics of Timberisland Very Gravelly Medial Sandy Loam

Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 6 inches; very gravelly medial sandy loam
A2—6 to 14 inches; very gravelly medial sandy loam
Bw1—14 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 35 inches; extremely cobbly medial sandy loam
Bw3—35 to 48 inches; extremely cobbly medial sandy loam
2R—48 inches; bedrock

Characteristics of Lavatop Gravelly Medial Fine Sandy Loam

Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges

Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, white fir, Douglas-fir, California black oak, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent coarse, subangular gravel, 0 to 40 percent subangular cobbles, 0 to 30 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; gravelly medial fine sandy loam
Bw1—4 to 15 inches; very gravelly medial sandy loam
Bw2—15 to 26 inches; extremely gravelly medial sandy loam
R—26 inches; bedrock

Minor Components in Map Unit 903

Lumpkin and similar soils
Composition: 3 percent
Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

Escarpments
Composition: 2 percent
Slope: 30 to 100 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

Lava flows
Composition: 2 percent
Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

Soils that are underlain by paralithic bedrock
Composition: 1 percent
Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 1 percent
Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

Soils that are less than 10 inches deep to lithic bedrock
Composition: 1 percent
Slope: 2 to 30 percent
Geomorphic position: The top and side slopes of basalt ridges
Hydric soil status: Not hydric

904—Lava flows-Lavatop complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 5,200 feet (975 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Lava flows (Lovejoy basalt)—60 percent
Lavatop gravelly medial fine sandy loam—20 percent
Minor components—20 percent

Characteristics of Lava Flows (Lovejoy Basalt)

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Surface runoff (bare conditions): Very high
Definition: Lava flows consist of exposed basalt formed from lateral surficial outpouring of molten lava from a vent or fissure.

Characteristics of Lavatop Gravelly Medial Fine Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Scattered ponderosa pine, greenleaf manzanita, California black oak, buckwheat, and annual grasses and forbs
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 30 percent coarse, subangular gravel, 0 to 40 percent subangular cobbles, 0 to 30 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Very low (about 1.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; gravelly medial fine sandy loam
Bw1—4 to 15 inches; very gravelly medial sandy loam
Bw2—15 to 26 inches; extremely gravelly medial sandy loam
R—26 inches; bedrock

Minor Components in Map Unit 904

Lumpkin and similar soils
Composition: 5 percent
Slope: 2 to 15 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Timberisland and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Escarpments
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Springs and riparian areas
Composition: 2 percent
Slope: 2 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Hydric

905—Lava flows-Lumpkin complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Wildlife habitat and watershed

Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 5,200 feet (975 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Lava flows (Lovejoy basalt)—60 percent
Lumpkin gravelly medial sandy loam—30 percent
Minor components—10 percent

Characteristics of Lava Flows (Lovejoy Basalt)

Slope: 30 to 50 percent
Geomorphic position: Benches on side slopes on basalt ridges
Surface runoff (bare conditions): Very high
Definition: Lava flows consist of exposed basalt formed from lateral surficial outpouring of molten lava from a vent or fissure.

Characteristics of Lumpkin Gravelly Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Scattered ponderosa pine, greenleaf manzanita, California black oak, buckwheat, and annual grasses and forbs
Texture of the surface layer: Gravelly medial sandy loam
Percentage of the surface covered by rock fragments: 10 to 80 percent coarse gravel, 2 to 20 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly medial sandy loam
Bw1—3 to 8 inches; extremely gravelly medial fine sandy loam
Bw2—8 to 14 inches; extremely cobbly medial sandy loam
R—14 inches; bedrock

Minor Components in Map Unit 905

Escarpments
Composition: 5 percent
Slope: 50 to 100 percent

Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Lavatop and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Springs and riparian areas
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Hydric

906—Lava flows-Lumpkin complex, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,195 to 5,200 feet (975 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Lava flows (Lovejoy basalt)—60 percent
Lumpkin gravelly medial sandy loam—30 percent
Minor components—10 percent

Characteristics of Lava Flows (Lovejoy Basalt)

Slope: 50 to 70 percent
Geomorphic position: Benches on side slopes on basalt ridges
Surface runoff (bare conditions): Very high
Definition: Lava flows consist of exposed basalt formed from lateral surficial outpouring of molten lava from a vent or fissure.

Characteristics of Lumpkin Gravelly Medial Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Scattered ponderosa pine, greenleaf manzanita, California black oak, buckwheat, and annual grasses and forbs

Texture of the surface layer: Gravelly medial sandy loam
Percentage of the surface covered by rock fragments: 10 to 80 percent coarse gravel, 2 to 20 percent cobbles, 0 to 5 percent stones
Depth to a restrictive feature (lithic bedrock): 10 to 20 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 3 inches; gravelly medial sandy loam
Bw1—3 to 8 inches; extremely gravelly medial fine sandy loam
Bw2—8 to 14 inches; extremely cobbly medial sandy loam
R—14 inches; bedrock

Minor Components in Map Unit 906

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Escarpments
Composition: 3 percent
Slope: 70 to 100 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Soils that have slopes of less than 50 percent and are on narrow benches
Composition: 3 percent
Slope: 2 to 50 percent
Geomorphic position: Benches on side slopes on basalt ridges
Hydric soil status: Not hydric

911—Endoaquolls, 0 to 8 percent slopes

Map Unit Setting

General location: Northeastern Butte County
Major uses: Watershed, wildlife habitat, and livestock grazing
Major land resource area: 22B
Landscape: Northern Sierra Nevada and Southern Cascade Mountains
Elevation: 3,595 to 4,995 feet (1,097 to 1,524 meters)
Mean annual precipitation: 65 to 75 inches (1,651 to 1,905 millimeters)

Mean annual air temperature: 48 to 54 degrees F (9 to 12 degrees C)
Frost-free period: 100 to 180 days

Map Unit Composition

Endoaquolls loam—75 percent
Minor components—25 percent

Characteristics of Endoaquolls Loam

Slope: 0 to 8 percent
Geomorphic position: Meadows in volcanic and metamorphic mountains
Parent material: Fine-loamy alluvium over clayey alluvium over fine-loamy alluvium derived from volcanic and metamorphic rocks
Observed vegetation: Sedges, rushes, annual grasses and forbs, willows, lodgepole pine, ponderosa pine, and incense cedar
Texture of the surface layer: Loam
Percentage of the surface covered by rock fragments: None
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Occasional
Annual ponding frequency: None
Depth to a water table (zone of saturation): 0 to 17 inches
Available water capacity: Very high (about 10.4 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 3 inches; loam
A2—3 to 8 inches; loam
A3—8 to 17 inches; clay loam
Bw—17 to 28 inches; silty clay
Ab—28 to 43 inches; silty clay
2Bg1—43 to 58 inches; loam
2Bg2—58 to 73 inches; sandy clay loam

Minor Components in Map Unit 911

Endoaquolls, frequently flooded for long periods, and similar soils
Composition: 12 percent
Slope: 0 to 8 percent
Geomorphic position: Seeps and channels in meadows in volcanic and metamorphic mountains
Hydric soil status: Hydric

Bonepile taxadjunct, duripan substratum, and similar soils
Composition: 5 percent
Slope: 0 to 8 percent
Geomorphic position: Stream terraces in volcanic mountains
Hydric soil status: Not hydric

Endoaquolls, very gravelly substratum, and similar soils
Composition: 3 percent
Slope: 0 to 8 percent
Geomorphic position: Meadows in volcanic and metamorphic mountains
Hydric soil status: Hydric

Aquic Xerofluvents and similar soils
Composition: 3 percent
Slope: 0 to 4 percent
Geomorphic position: Meadows in volcanic and metamorphic mountains
Hydric soil status: Hydric

Xerofluvents and similar soils
Composition: 2 percent
Slope: 0 to 4 percent
Geomorphic position: Channels in meadows in volcanic and metamorphic mountains
Hydric soil status: Hydric

923—Powderhouse-McNair-Greenwell complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,595 to 5,695 feet (1,402 to 1,737 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Powderhouse medial sandy loam—45 percent
McNair medial coarse sandy loam—25 percent
Greenwell medial sandy loam—20 percent
Minor components—10 percent

Characteristics of Powderhouse Medial Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Mixed tephra and gravelly and cobbly residuum weathered from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, huckleberry oak, greenleaf manzanita, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; medial sandy loam
A2—4 to 11 inches; medial sandy loam
Bw—11 to 27 inches; very cobbly medial sandy loam
C—27 to 36 inches; very gravelly medial coarse sandy loam
Cr—36 to 82 inches; bedrock

Characteristics of McNair Medial Coarse Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Mixed tephra and gravelly residuum weathered from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Very low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 6 inches; medial coarse sandy loam
A2—6 to 16 inches; gravelly medial coarse sandy loam
Bw1—16 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 33 inches; very gravelly medial sandy loam
Bw3—33 to 48 inches; very gravelly medial sandy loam

BC—48 to 57 inches; extremely gravelly coarse sandy loam
Cr—57 to 88 inches; bedrock

Characteristics of Greenwell Medial Sandy Loam

Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Parent material: Mixed tephra and gravelly residuum weathered from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 5 inches; medial sandy loam
A2—5 to 10 inches; medial sandy loam
Bw—10 to 18 inches; gravelly medial sandy loam
2BC1—18 to 23 inches; medial sandy loam
2BC2—23 to 32 inches; very gravelly medial sandy loam
2Cr—32 inches; bedrock

Minor Components in Map Unit 923

Rock outcrop
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Medial-skeletal soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 2 percent
Slope: 2 to 15 percent

Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Powderhouse very gravelly medial sandy loam and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

Lumpkin taxadjunct and similar soils
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: The top of volcanic ridges
Hydric soil status: Not hydric

924—Powderhouse-McNair-Greenwell complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,595 to 5,695 feet (1,402 to 1,737 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Powderhouse medial sandy loam—45 percent
McNair medial coarse sandy loam—25 percent
Greenwell medial sandy loam—20 percent
Minor components—10 percent

Characteristics of Powderhouse Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.3 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; medial sandy loam
A2—4 to 11 inches; medial sandy loam
Bw—11 to 27 inches; very cobbly medial sandy loam
C—27 to 36 inches; very gravelly medial coarse sandy loam
Cr—36 to 82 inches; bedrock

Characteristics of McNair Medial Coarse Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 6 inches; medial coarse sandy loam
A2—6 to 16 inches; gravelly medial coarse sandy loam
Bw1—16 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 33 inches; very gravelly medial sandy loam
Bw3—33 to 48 inches; very gravelly medial sandy loam
BC—48 to 57 inches; extremely gravelly coarse sandy loam
Cr—57 to 88 inches; bedrock

Characteristics of Greenwell Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 5 inches; medial sandy loam
A2—5 to 10 inches; medial sandy loam
Bw—10 to 18 inches; gravelly medial sandy loam
2BC1—18 to 23 inches; medial sandy loam
2BC2—23 to 32 inches; very gravelly medial sandy loam
2Cr—32 inches; bedrock

Minor Components in Map Unit 924

Medial-skeletal soils that have 18 to 27 percent clay
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Drainageways and riparian areas on side slopes on volcanic ridges
Hydric soil status: Not hydric

Medial-skeletal soils that are more than 60 inches deep to bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Medial soils that have more than 18 percent clay and are on north-facing slopes
Composition: 2 percent
Slope: 15 to 30 percent

Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lumpkin taxadjunct and similar soils
Composition: 1 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

925—Powderhouse-McNair-Greenwell complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,595 to 5,695 feet (1,402 to 1,737 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Powderhouse medial sandy loam—45 percent
McNair medial coarse sandy loam—25 percent
Greenwell medial sandy loam—20 percent
Minor components—10 percent

Characteristics of Powderhouse Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed

Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; medial sandy loam
A2—4 to 11 inches; medial sandy loam
Bw—11 to 27 inches; very cobbly medial sandy loam
C—27 to 36 inches; very gravelly medial coarse sandy loam
Cr—36 to 82 inches; bedrock

Characteristics of McNair Medial Coarse Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.8 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 3 inches; slightly decomposed plant material
A1—3 to 6 inches; medial coarse sandy loam
A2—6 to 16 inches; gravelly medial coarse sandy loam
Bw1—16 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 33 inches; very gravelly medial sandy loam
Bw3—33 to 48 inches; very gravelly medial sandy loam
BC—48 to 57 inches; extremely gravelly coarse sandy loam
Cr—57 to 88 inches; bedrock

Characteristics of Greenwell Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from volcanic mudflow
Observed vegetation: White fir, California red fir, incense cedar, sugar pine, ponderosa pine, whitethorn ceanothus, greenleaf manzanita, huckleberry oak, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones, 0 to 5 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 3.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 5 inches; medial sandy loam
A2—5 to 10 inches; medial sandy loam
Bw—10 to 18 inches; gravelly medial sandy loam
2BC1—18 to 23 inches; medial sandy loam
2BC2—23 to 32 inches; very gravelly medial sandy loam
2Cr—32 inches; bedrock

Minor Components in Map Unit 925

Medial-skeletal soils that are more than 60 inches deep to bedrock
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Medial soils that have more than 18 percent clay and are on north-facing slopes
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Soils that have slopes of more than 50 percent
Composition: 2 percent
Slope: 50 to 70 percent

Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

Lumpkin taxadjunct and similar soils
Composition: 1 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on volcanic ridges
Hydric soil status: Not hydric

930—Shakeridge-Timberisland complex, 0 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,495 feet (1,097 to 1,676 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Shakeridge gravelly medial coarse sandy loam—50 percent
Timberisland very gravelly medial sandy loam—40 percent
Minor components—10 percent

Characteristics of Shakeridge Gravelly Medial Coarse Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, huckleberry oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 20 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.4 inches)

Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; gravelly medial coarse sandy loam
A2—4 to 7 inches; gravelly medial coarse sandy loam
Bw1—7 to 19 inches; extremely gravelly medial coarse sandy loam
Bw2—19 to 25 inches; extremely gravelly medial coarse sandy loam
Bw3—25 to 36 inches; very gravelly medial coarse sandy loam
Bw4—36 to 55 inches; extremely gravelly medial coarse sandy loam
Bw5—55 to 71 inches; extremely gravelly medial coarse sandy loam
Bw6—71 to 87 inches; extremely gravelly coarse sandy loam

Characteristics of Timberisland Very Gravelly Medial Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, huckleberry oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 6 inches; very gravelly medial sandy loam
A2—6 to 14 inches; very gravelly medial sandy loam
Bw1—14 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 35 inches; extremely cobbly medial sandy loam
Bw3—35 to 48 inches; extremely cobbly medial sandy loam
2R—48 inches; bedrock

Minor Components in Map Unit 930

Lavatop and similar soils
Composition: 2 percent
Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

Mudwash and similar soils
Composition: 2 percent
Slope: 0 to 5 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

Lumpkin and similar soils
Composition: 2 percent
Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

Escarpments
Composition: 2 percent
Slope: 15 to 70 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

Lava flows
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

Medial soils that are more than 60 inches deep to lithic bedrock
Composition: 1 percent
Slope: 0 to 15 percent
Geomorphic position: Benches and the top of basalt ridges
Hydric soil status: Not hydric

931—Shakeridge-Mudwash-Timberisland complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,495 feet (1,097 to 1,676 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 45 to 52 degrees F (7 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Shakeridge gravelly medial coarse sandy loam—40 percent
Mudwash gravelly medial sandy loam—25 percent
Timberisland very gravelly medial sandy loam—15 percent
Minor components—20 percent

Characteristics of Shakeridge Gravelly Medial Coarse Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, huckleberry oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 20 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; gravelly medial coarse sandy loam
A2—4 to 7 inches; gravelly medial coarse sandy loam
Bw1—7 to 19 inches; extremely gravelly medial coarse sandy loam
Bw2—19 to 25 inches; extremely gravelly medial coarse sandy loam
Bw3—25 to 36 inches; very gravelly medial coarse sandy loam
Bw4—36 to 55 inches; extremely gravelly medial coarse sandy loam
Bw5—55 to 71 inches; extremely gravelly medial coarse sandy loam
Bw6—71 to 87 inches; extremely gravelly coarse sandy loam

Characteristics of Mudwash Gravelly Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, huckleberry oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None

Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oa—1 to 4 inches; moderately decomposed plant material
A1—4 to 8 inches; gravelly medial sandy loam
A2—8 to 13 inches; gravelly medial sandy loam
Bw—13 to 26 inches; gravelly medial sandy loam
2Bt1—26 to 35 inches; gravelly loam
2Bt2—35 to 52 inches; gravelly loam
2BCt—52 to 72 inches; extremely gravelly loam
2Cr—72 to 89 inches; bedrock

Characteristics of Timberisland Very Gravelly Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly and cobbly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, huckleberry oak, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 5 to 40 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles, 0 to 15 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (lithic bedrock): 40 to 60 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
Oe—2 to 3 inches; moderately decomposed plant material
A1—3 to 6 inches; very gravelly medial sandy loam
A2—6 to 14 inches; very gravelly medial sandy loam

Bw1—14 to 25 inches; very gravelly medial sandy loam
Bw2—25 to 35 inches; extremely cobbly medial sandy loam
Bw3—35 to 48 inches; extremely cobbly medial sandy loam
2R—48 inches; bedrock

Minor Components in Map Unit 931

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Lavatop and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Soils that have slopes of more than 30 percent
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Soils that have slopes of less than 15 percent
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Soils that have more than 27 percent clay
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Lava flows
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Lumpkin and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Springs and riparian areas
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Hydric

932—Shakeridge-Mudwash complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,495 feet (1,097 to 1,676 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 46 to 52 degrees F (8 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Shakeridge gravelly medial coarse sandy loam—50 percent
Mudwash gravelly medial sandy loam—35 percent
Minor components—15 percent

Characteristics of Shakeridge Gravelly Medial Coarse Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, and huckleberry oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 20 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones
Depth to a restrictive feature (lithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 2.4 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 2 inches; slightly decomposed plant material
- A1—2 to 4 inches; gravelly medial coarse sandy loam
- A2—4 to 7 inches; gravelly medial coarse sandy loam
- Bw1—7 to 19 inches; extremely gravelly medial coarse sandy loam
- Bw2—19 to 25 inches; extremely gravelly medial coarse sandy loam
- Bw3—25 to 36 inches; very gravelly medial coarse sandy loam
- Bw4—36 to 55 inches; extremely gravelly medial coarse sandy loam

Bw5—55 to 71 inches; extremely gravelly medial coarse sandy loam
Bw6—71 to 87 inches; extremely gravelly coarse sandy loam

Characteristics of Mudwash Gravelly Medial Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, and huckleberry oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 5.5 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
Oa—1 to 4 inches; moderately decomposed plant material
A1—4 to 8 inches; gravelly medial sandy loam
A2—8 to 13 inches; gravelly medial sandy loam
Bw—13 to 26 inches; gravelly medial sandy loam
2Bt1—26 to 35 inches; gravelly loam
2Bt2—35 to 52 inches; gravelly loam
2BCt—52 to 72 inches; extremely gravelly loam
2Cr—72 to 89 inches; bedrock

Minor Components in Map Unit 932

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Lavatop and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Talus
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Escarpments
Composition: 2 percent
Slope: 50 to 100 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Timberisland and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

Soils that have quartz diorite in the substratum
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on basalt ridges
Hydric soil status: Not hydric

933—Shakeridge gravelly medial coarse sandy loam, 50 to 70 percent slopes

Map Unit Setting

General location: Eastern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,495 feet (1,097 to 1,676 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 52 degrees F (10 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Shakeridge gravelly medial coarse sandy loam—80 percent
Minor components—20 percent

Characteristics of Shakeridge Gravelly Medial Coarse Sandy Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, California black oak, white fir, sugar pine, deerbrush, and huckleberry oak
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 10 to 20 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones

Depth to a restrictive feature (lithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.4 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; gravelly medial coarse sandy loam
A2—4 to 7 inches; gravelly medial coarse sandy loam
Bw1—7 to 19 inches; extremely gravelly medial coarse sandy loam
Bw2—19 to 25 inches; extremely gravelly medial coarse sandy loam
Bw3—25 to 36 inches; very gravelly medial coarse sandy loam
Bw4—36 to 55 inches; extremely gravelly medial coarse sandy loam
Bw5—55 to 71 inches; extremely gravelly medial coarse sandy loam
Bw6—71 to 87 inches; extremely gravelly coarse sandy loam

Minor Components in Map Unit 933

Timberisland and similar soils
Composition: 9 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Mudwash and similar soils
Composition: 4 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Lavatop and similar soils
Composition: 3 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Medial soils that are more than 60 inches deep to lithic bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

Soils that are more than 40 inches deep to quartz diorite bedrock
Composition: 2 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on basalt ridges
Hydric soil status: Not hydric

934—Mudwash gravelly medial sandy loam, 0 to 15 percent slopes

Map Unit Setting

General location: Southern Butte County and southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,595 to 5,200 feet (1,097 to 1,585 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 45 to 52 degrees F (7 to 11 degrees C)
Frost-free period: 110 to 140 days

Map Unit Composition

Mudwash gravelly medial sandy loam—80 percent
Minor components—20 percent

Characteristics of Mudwash Gravelly Medial Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Parent material: Mixed tephra and gravelly residuum and/or colluvium derived from basalt
Observed vegetation: Ponderosa pine, incense cedar, white fir, sugar pine, whitethorn ceanothus, deerbrush, and manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subangular gravel, 0 to 25 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Moderate (about 5.5 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Low

Interpretive groups
- *Land capability, irrigated:* 3e-1
- *Land capability, nonirrigated:* 3e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- Oa—1 to 4 inches; moderately decomposed plant material
- A1—4 to 8 inches; gravelly medial sandy loam
- A2—8 to 13 inches; gravelly medial sandy loam
- Bw—13 to 26 inches; gravelly medial sandy loam
- 2Bt1—26 to 35 inches; gravelly loam
- 2Bt2—35 to 52 inches; gravelly loam
- 2BCt—52 to 72 inches; extremely gravelly loam
- 2Cr—72 to 89 inches; bedrock

Minor Components in Map Unit 934

Shakeridge and similar soils
Composition: 6 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 6 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

Springs and riparian areas
Composition: 4 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Hydric

Soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 4 percent
Slope: 0 to 15 percent
Geomorphic position: The top of basalt ridges
Hydric soil status: Not hydric

939—Fluvaquentic Humaquepts, 0 to 15 percent slopes

Map Unit Setting

General location: Southwestern Plumas County
Major uses: Wildlife habitat and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 3,995 to 5,400 feet (1,219 to 1,646 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 50 to 54 degrees F (10 to 12 degrees C)
Frost-free period: 110 to 150 days

Map Unit Composition

Fluvaquentic Humaquepts very fine sandy loam—85 percent
Minor components—15 percent

Characteristics of Fluvaquentic Humaquepts Very Fine Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: Meadows in granitic mountains
Parent material: Fine-loamy alluvium derived from quartz diorite
Observed vegetation: Sedges, rushes, annual grasses and forbs, and mountain alder
Texture of the surface layer: Very fine sandy loam
Percentage of the surface covered by rock fragments: 0 to 5 percent rounded gravel
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: Rare
Annual ponding frequency: None

Depth to a water table (zone of saturation): 0 to 60 inches
Available water capacity: High (about 9.4 inches)
Natural drainage class: Poorly drained
Surface runoff (bare conditions): Very high

Interpretive groups
Land capability, irrigated: 5w-2
Land capability, nonirrigated: 5w-2
Hydric soil status: Hydric
Hydrologic soil group: D

Typical profile
A1—0 to 7 inches; very fine sandy loam
A2—7 to 15 inches; very fine sandy loam
Bw1—15 to 22 inches; loam
Bw2—22 to 29 inches; loam
Bw3—29 to 36 inches; loam
2Bw—36 to 45 inches; gravelly clay loam
2BC—45 to 60 inches; gravelly loam

Minor Components in Map Unit 939

At an elevation of more than 4,800 feet, soils with a frigid soil temperature regime
Composition: 10 percent
Slope: 0 to 15 percent
Geomorphic position: Meadows in metamorphic mountains
Hydric soil status: Hydric

Soils that are partially drained
Composition: 5 percent
Slope: 0 to 2 percent
Geomorphic position: Meadows in granitic and metamorphic mountains
Hydric soil status: Not hydric

940—Dejonah-Stagpoint complex, 2 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,500 to 5,895 feet (1,372 to 1,798 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Dejonah gravelly loam—50 percent
Stagpoint loam—30 percent
Minor components—20 percent

Characteristics of Dejonah Gravelly Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Parent material: Fine-loamy residuum weathered from metamorphic rocks

Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 10 inches; loam
2Bt2—10 to 16 inches; loam
2Bt3—16 to 28 inches; loam
2Bt4—28 to 37 inches; loam
2BC1—37 to 53 inches; sandy loam
2BC2—53 to 60 inches; loam

Characteristics of Stagpoint Loam

Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Parent material: Loamy, cobbly and gravelly residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 17 inches; very gravelly loam
2Bt3—17 to 23 inches; very gravelly loam
2Bt4—23 to 34 inches; extremely cobbly loam
2BCt1—34 to 49 inches; extremely cobbly loam
2BCt2—49 to 64 inches; extremely stony loam
2C—64 to 86 inches; very stony loam

Minor Components in Map Unit 940

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 9 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

Haploxerands and similar soils
Composition: 3 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 18 percent clay
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 20 to 40 inches deep to bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 20 to 40 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

Soils that have more than 35 percent clay in the subsoil
Composition: 2 percent
Slope: 2 to 15 percent
Geomorphic position: Ridgetops and benches on metamorphic mountains
Hydric soil status: Not hydric

941—Dejonah-Stagpoint complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,500 to 5,895 feet (1,372 to 1,798 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Dejonah gravelly loam—50 percent
Stagpoint loam—30 percent
Minor components—20 percent

Characteristics of Dejonah Gravelly Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 8.9 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* Medium

Interpretive groups
- *Land capability, irrigated:* 4e-1
- *Land capability, nonirrigated:* 4e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 1 inch; slightly decomposed plant material
- A—1 to 4 inches; gravelly loam
- Bt1—4 to 10 inches; loam
- 2Bt2—10 to 16 inches; loam
- 2Bt3—16 to 28 inches; loam
- 2Bt4—28 to 37 inches; loam
- 2BC1—37 to 53 inches; sandy loam
- 2BC2—53 to 60 inches; loam

Characteristics of Stagpoint Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Parent material: Loamy, cobbly and gravelly colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 17 inches; very gravelly loam
2Bt3—17 to 23 inches; very gravelly loam
2Bt4—23 to 34 inches; extremely cobbly loam
2BCt1—34 to 49 inches; extremely cobbly loam
2BCt2—49 to 64 inches; extremely stony loam
2C—64 to 86 inches; very stony loam

Minor Components in Map Unit 941

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 9 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Hydric soil status: Not hydric

Loamy-skeletal alluvial soils that have a high content of quartz
Composition: 4 percent
Slope: 15 to 30 percent
Geomorphic position: Draws on metamorphic mountains
Hydric soil status: Not hydric

Soils that have a high content of silt and overlie metatuff
Composition: 3 percent
Slope: 15 to 30 percent

Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 18 percent clay
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Hydric soil status: Not hydric

Soils that are 40 to 60 inches deep to paralithic bedrock
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes, ridgetops, and benches on metamorphic mountains
Hydric soil status: Not hydric

942—Stagpoint-Dejonah complex, 30 to 50 percent slopes

Map Unit Setting

General location: Eastern Butte County and western Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,500 to 5,895 feet (1,372 to 1,798 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Stagpoint loam—50 percent
Dejonah gravelly loam—30 percent
Minor components—20 percent

Characteristics of Stagpoint Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Parent material: Loamy, cobbly and gravelly colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones, 0 to 5 percent subangular boulders
Depth to a restrictive feature (paralithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 17 inches; very gravelly loam
2Bt3—17 to 23 inches; very gravelly loam
2Bt4—23 to 34 inches; extremely cobbly loam
2BCt1—34 to 49 inches; extremely cobbly loam
2BCt2—49 to 64 inches; extremely stony loam
2C—64 to 86 inches; very stony loam

Characteristics of Dejonah Gravelly Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material
A—1 to 4 inches; gravelly loam
Bt1—4 to 10 inches; loam
2Bt2—10 to 16 inches; loam
2Bt3—16 to 28 inches; loam
2Bt4—28 to 37 inches; loam
2BC1—37 to 53 inches; sandy loam
2BC2—53 to 60 inches; loam

Minor Components in Map Unit 942

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 9 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have more than 35 percent clay in the subsoil
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 18 percent clay
Composition: 4 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that are underlain by metagabbro bedrock (paralithic)
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metamorphic mountains
Hydric soil status: Not hydric

948—Stagpoint-Dejonah complex, 50 to 70 percent slopes

Map Unit Setting

General location: Southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,500 to 5,895 feet (1,372 to 1,798 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Stagpoint loam—55 percent
Dejonah gravelly loam—35 percent
Minor components—10 percent

Characteristics of Stagpoint Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Loamy, cobbly and gravelly colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles, 0 to 5 percent subangular stones, 0 to 5 percent subangular boulders

Depth to a restrictive feature (paralithic bedrock): 60 to 100 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Low (about 4.0 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 4 inches; loam
Bt1—4 to 10 inches; gravelly loam
Bt2—10 to 17 inches; very gravelly loam
2Bt3—17 to 23 inches; very gravelly loam
2Bt4—23 to 34 inches; extremely cobbly loam
2BCt1—34 to 49 inches; extremely cobbly loam
2BCt2—49 to 64 inches; extremely stony loam
2C—64 to 86 inches; very stony loam

Characteristics of Dejonah Gravelly Loam

Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from metamorphic rocks
Observed vegetation: White fir, California red fir, sugar pine, incense cedar, ponderosa pine, Sierra chinquapin, whitethorn ceanothus, and greenleaf manzanita
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subangular gravel, 0 to 10 percent subangular cobbles
Depth to a restrictive feature (paralithic bedrock): 60 to 80 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 8.9 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 7e-1
Land capability, nonirrigated: 7e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 1 inch; slightly decomposed plant material

A—1 to 4 inches; gravelly loam
Bt1—4 to 10 inches; loam
2Bt2—10 to 16 inches; loam
2Bt3—16 to 28 inches; loam
2Bt4—28 to 37 inches; loam
2BC1—37 to 53 inches; sandy loam
2BC2—53 to 60 inches; loam

Minor Components in Map Unit 948

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 9 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

Soils that have less than 18 percent clay
Composition: 1 percent
Slope: 50 to 70 percent
Geomorphic position: Backslopes on metamorphic mountains
Hydric soil status: Not hydric

949—Rogerville taxadjunct, 30 to 50 percent slopes

Map Unit Setting

General location: Southwestern Plumas County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 4,795 to 5,600 feet (1,463 to 1,707 meters)
Mean annual precipitation: 75 to 80 inches (1,905 to 2,032 millimeters)
Mean annual air temperature: 45 to 50 degrees F (7 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Rogerville taxadjunct fine sandy loam—80 percent
Minor components—20 percent

Characteristics of Rogerville Taxadjunct Fine Sandy Loam

Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Parent material: Fine-loamy colluvium and/or residuum weathered from ultramafic rocks
Observed vegetation: White fir, California red fir, incense cedar, Douglas-fir, sugar pine, whitethorn ceanothus, Sierra chinquapin, huckleberry oak, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded gravel
Depth to a restrictive feature (paralithic bedrock): 40 to 60 inches
Shrink-swell potential: Moderate (LEP of 3 to less than 6)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Moderate (about 6.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A—2 to 4 inches; fine sandy loam
Bw1—4 to 7 inches; gravelly sandy loam
Bw2—7 to 21 inches; very gravelly sandy loam
Bw3—21 to 26 inches; very gravelly loam
2Bt1—26 to 33 inches; gravelly silt loam
2Bt2—33 to 44 inches; gravelly silt loam
2Bt3—44 to 57 inches; gravelly silty clay loam
2Cr—57 inches; bedrock

Minor Components in Map Unit 949

Soils that are 10 to 20 inches deep to peridotite bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are more than 60 inches deep to peridotite bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Loamy-skeletal soils that are 40 to 60 inches deep to bedrock
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on ultramafic mountains
Hydric soil status: Not hydric

Dejonah gravelly loam and similar soils
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

Stagpoint loam and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic mountains
Hydric soil status: Not hydric

950—Lumpkin taxadjunct-Rock outcrop-Powderhouse complex, 0 to 15 percent slopes

Map Unit Setting

General location: Eastern Butte County and western Plumas County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 22A
Landscape: Northern Sierra Nevada and Southern Cascade Mountains
Elevation: 4,520 to 6,115 feet (1,378 to 1,865 meters)
Mean annual precipitation: 75 to 85 inches (1,905 to 2,159 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Lumpkin taxadjunct very gravelly medial very fine sandy loam—40 percent
Rock outcrop (olivine basalt, andesite, or mudflow)—25 percent
Powderhouse medial sandy loam—20 percent
Minor components—15 percent

Characteristics of Lumpkin Taxadjunct Very Gravelly Medial Very Fine Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: The top and side slopes of volcanic nunataks and ridges
Parent material: Mixed tephra and cobbly and gravelly residuum weathered from volcanic rocks
Observed vegetation: Scattered ponderosa pine, incense cedar, California red fir, white fir, California black oak, whitethorn ceanothus, greenleaf manzanita, buckwheat, and annual grasses and forbs
Texture of the surface layer: Very gravelly medial very fine sandy loam
Percentage of the surface covered by rock fragments: 15 to 30 percent subrounded cobbles, 50 to 70 percent subrounded gravel, 0 to 20 percent subrounded stones
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* Very low (about 0.7 inch)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 8
- *Land capability, nonirrigated:* 8
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* D

Typical profile
- A—0 to 4 inches; very gravelly medial very fine sandy loam
- Bw—4 to 9 inches; very gravelly medial very fine sandy loam
- R—9 inches; bedrock

Characteristics of Rock Outcrop (Olivine Basalt, Andesite, or Mudflow)

Slope: 0 to 15 percent
Geomorphic position: The top and side slopes of volcanic nunataks and ridges
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Powderhouse Medial Sandy Loam

Slope: 0 to 15 percent
Geomorphic position: The top and side slopes of volcanic nunataks and ridges
Parent material: Mixed tephra and cobbly and gravelly residuum weathered from volcanic rocks
Observed vegetation: White fir, California red fir, incense cedar, ponderosa pine, greenleaf manzanita, huckleberry oak, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; medial sandy loam
A2—4 to 11 inches; medial sandy loam
Bw—11 to 27 inches; very cobbly medial sandy loam
C—27 to 36 inches; very gravelly medial coarse sandy loam
Cr—36 to 82 inches; bedrock

Minor Components in Map Unit 950

Medial-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: The top and side slopes of volcanic nunataks and ridges
Hydric soil status: Not hydric

Cliffs
Composition: 3 percent
Slope: 15 to 50 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Hydric soil status: Not hydric

Talus
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Hydric soil status: Not hydric

Haploxerands, volcanic till, and similar soils
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: Ridgetops and side slopes on moraines
Hydric soil status: Not hydric

At an elevation of less than 4,800 feet, soils with a mesic soil temperature regime
Composition: 3 percent
Slope: 0 to 15 percent
Geomorphic position: The top and side slopes of volcanic ridges
Hydric soil status: Not hydric

951—Lumpkin taxadjunct-Rock outcrop-Powderhouse complex, 15 to 30 percent slopes

Map Unit Setting

General location: Eastern Butte County and western Plumas County
Major uses: Wildlife habitat, watershed, and limited timber production
Major land resource area: 22A
Landscape: Southern Cascade Mountains
Elevation: 4,520 to 6,115 feet (1,378 to 1,865 meters)
Mean annual precipitation: 75 to 85 inches (1,905 to 2,159 millimeters)
Mean annual air temperature: 48 to 50 degrees F (9 to 10 degrees C)
Frost-free period: 80 to 110 days

Map Unit Composition

Lumpkin taxadjunct very gravelly medial very fine sandy loam—40 percent
Rock outcrop (andesite)—25 percent
Powderhouse medial sandy loam—20 percent
Minor components—15 percent

Characteristics of Lumpkin Taxadjunct Very Gravelly Medial Very Fine Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Parent material: Mixed tephra and cobbly and gravelly residuum and/or colluvium derived from andesite
Observed vegetation: Scattered ponderosa pine, incense cedar, California red fir, white fir, California black oak, whitethorn ceanothus, greenleaf manzanita, buckwheat, and annual grasses and forbs
Texture of the surface layer: Very gravelly medial very fine sandy loam
Percentage of the surface covered by rock fragments: 15 to 30 percent subrounded cobbles, 50 to 70 percent subrounded gravel, 0 to 20 percent subrounded stones
Depth to a restrictive feature (lithic bedrock): 5 to 10 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None

Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 0.7 inch)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 8
Land capability, nonirrigated: 8
Hydric soil status: Not hydric
Hydrologic soil group: D

Typical profile
A—0 to 4 inches; very gravelly medial very fine sandy loam
Bw—4 to 9 inches; very gravelly medial very fine sandy loam
R—9 inches; bedrock

Characteristics of Rock Outcrop (Andesite)

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Surface runoff (bare conditions): Very high
Definition: Rock outcrop consists of exposures of bedrock with no soil.

Characteristics of Powderhouse Medial Sandy Loam

Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Parent material: Mixed tephra and cobbly and gravelly residuum and/or colluvium derived from andesite
Observed vegetation: White fir, California red fir, incense cedar, ponderosa pine, greenleaf manzanita, huckleberry oak, whitethorn ceanothus, and Sierra chinquapin
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 10 percent coarse, subrounded gravel, 0 to 10 percent subrounded cobbles, 0 to 10 percent subrounded stones, 0 to 10 percent subrounded boulders
Depth to a restrictive feature (paralithic bedrock): 20 to 40 inches
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: Very low (about 2.3 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 6e-1
Land capability, nonirrigated: 6e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 2 inches; slightly decomposed plant material
A1—2 to 4 inches; medial sandy loam
A2—4 to 11 inches; medial sandy loam
Bw—11 to 27 inches; very cobbly medial sandy loam

C—27 to 36 inches; very gravelly medial coarse sandy loam
Cr—36 to 82 inches; bedrock

Minor Components in Map Unit 951

Medial-skeletal soils that are 10 to 20 inches deep to bedrock
Composition: 6 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Hydric soil status: Not hydric

Cliffs
Composition: 3 percent
Slope: 30 to 70 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Hydric soil status: Not hydric

Talus
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on volcanic nunataks and ridges
Hydric soil status: Not hydric

Haploxerands, volcanic till, and similar soils
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on moraines
Hydric soil status: Not hydric

960—Surnuf gravelly loam, 3 to 8 percent slopes, high elevation

Map Unit Setting

General location: Eastern Butte County and northern Yuba County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,280 feet (610 to 1,000 meters)
Mean annual precipitation: 58 to 65 inches (1,473 to 1,651 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Surnuf gravelly loam, high elevation—85 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam, High Elevation

Slope: 3 to 8 percent
Geomorphic position: Ridgetops on metavolcanic and intrusive igneous mountains
Parent material: Clayey residuum weathered from intrusive igneous and metamorphic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, tanoak, Pacific madrone, mountain misery, and deerbrush

Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subrounded stones, 0 to 5 percent subrounded cobbles, 0 to 20 percent subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Low

Interpretive groups
Land capability, irrigated: 2e-1
Land capability, nonirrigated: 2e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 6 inches; gravelly loam
AB—6 to 10 inches; gravelly loam
Bt1—10 to 20 inches; clay loam
Bt2—20 to 28 inches; clay loam
Bt3—28 to 38 inches; gravelly clay
Bt4—38 to 52 inches; gravelly clay
Bt5—52 to 67 inches; gravelly clay
Bt6—67 to 84 inches; gravelly clay

Minor Components in Map Unit 960

Surnuf soils with a subsoil of silty clay and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Ridgetops on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

Sites and similar soils
Composition: 5 percent
Slope: 3 to 8 percent
Geomorphic position: Ridgetops on metasedimentary mountains
Hydric soil status: Not hydric

Soils that have a skeletal subsoil
Composition: 3 percent
Slope: 3 to 8 percent
Geomorphic position: Ridgetops on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

Surnuf soils with slopes of as much as 15 percent and similar soils
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Ridgetops on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

961—Surnuf gravelly loam, 8 to 15 percent slopes, high elevation

Map Unit Setting

General location: Eastern Butte County and northern Yuba County
Major uses: Timber production, homesite development, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,280 feet (610 to 1,000 meters)
Mean annual precipitation: 58 to 65 inches (1,473 to 1,651 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Surnuf gravelly loam, high elevation—85 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam, High Elevation

Slope: 8 to 15 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Parent material: Clayey residuum and/or colluvium derived from intrusive igneous and metamorphic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, tanoak, Pacific madrone, mountain misery, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subrounded stones, 0 to 5 percent subrounded cobbles, 0 to 20 percent subrounded gravel
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): Medium

Interpretive groups
Land capability, irrigated: 3e-1
Land capability, nonirrigated: 3e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 6 inches; gravelly loam
AB—6 to 10 inches; gravelly loam
Bt1—10 to 20 inches; clay loam
Bt2—20 to 28 inches; clay loam
Bt3—28 to 38 inches; gravelly clay
Bt4—38 to 52 inches; gravelly clay
Bt5—52 to 67 inches; gravelly clay
Bt6—67 to 84 inches; gravelly clay

Minor Components in Map Unit 961

Surnuf soils with a subsoil of silty clay and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

Sites loam and similar soils
Composition: 5 percent
Slope: 8 to 15 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Soils that have a skeletal subsoil
Composition: 3 percent
Slope: 8 to 15 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

At an elevation of less than 2,800 feet, Surnuf soils on north-facing slopes and similar soils
Composition: 2 percent
Slope: 8 to 15 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

962—Surnuf gravelly loam, 15 to 30 percent slopes, high elevation

Map Unit Setting

General location: Eastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,280 feet (610 to 1,000 meters)
Mean annual precipitation: 58 to 65 inches (1,473 to 1,651 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Surnuf gravelly loam, high elevation—85 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam, High Elevation

Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Parent material: Clayey residuum and/or colluvium derived from intrusive igneous and metamorphic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, tanoak, Pacific madrone, mountain misery, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 5 percent subrounded stones, 0 to 5 percent subrounded cobbles, 0 to 20 percent subrounded gravel

Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
Annual flooding frequency: None
Annual ponding frequency: None
Water table (zone of saturation): None observed
Available water capacity: High (about 7.6 inches)
Natural drainage class: Well drained
Surface runoff (bare conditions): High

Interpretive groups
Land capability, irrigated: 4e-1
Land capability, nonirrigated: 4e-1
Hydric soil status: Not hydric
Hydrologic soil group: B

Typical profile
Oi—0 to 0.5 inch; slightly decomposed plant material
A—0.5 inch to 6 inches; gravelly loam
AB—6 to 10 inches; gravelly loam
Bt1—10 to 20 inches; clay loam
Bt2—20 to 28 inches; clay loam
Bt3—28 to 38 inches; gravelly clay
Bt4—38 to 52 inches; gravelly clay
Bt5—52 to 67 inches; gravelly clay
Bt6—67 to 84 inches; gravelly clay

Minor Components in Map Unit 962

Surnuf soils with a subsoil of silty clay and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

Sites loam and similar soils
Composition: 5 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Soils that have a skeletal subsoil
Composition: 3 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

At an elevation of less than 2,800 feet, Surnuf soils on north-facing slopes and similar soils
Composition: 2 percent
Slope: 15 to 30 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

963—Surnuf gravelly loam, 30 to 50 percent slopes, high elevation

Map Unit Setting

General location: Southeastern Butte County
Major uses: Timber production, wildlife habitat, and watershed
Major land resource area: 22A
Landscape: Northern Sierra Nevada Mountains
Elevation: 2,000 to 3,280 feet (610 to 1,000 meters)
Mean annual precipitation: 58 to 65 inches (1,473 to 1,651 millimeters)
Mean annual air temperature: 54 to 55 degrees F (12 to 13 degrees C)
Frost-free period: 160 to 230 days

Map Unit Composition

Surnuf gravelly loam, high elevation—85 percent
Minor components—15 percent

Characteristics of Surnuf Gravelly Loam, High Elevation

Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Parent material: Clayey residuum and/or colluvium derived from intrusive igneous and metamorphic rocks
Observed vegetation: Ponderosa pine, Douglas-fir, incense cedar, tanoak, Pacific madrone, mountain misery, and deerbrush
Texture of the surface layer: Slightly decomposed plant material
Percentage of the surface covered by rock fragments: 0 to 20 percent coarse, subrounded gravel, 0 to 5 percent subrounded cobbles, 0 to 5 percent subrounded stones
Restrictive feature: None identified
Shrink-swell potential: High (LEP of 6 to 9)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* None
- *Annual ponding frequency:* None
- *Water table (zone of saturation):* None observed
- *Available water capacity:* High (about 7.6 inches)
- *Natural drainage class:* Well drained
- *Surface runoff (bare conditions):* High

Interpretive groups
- *Land capability, irrigated:* 6e-1
- *Land capability, nonirrigated:* 6e-1
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* B

Typical profile
- Oi—0 to 0.5 inch; slightly decomposed plant material
- A—0.5 inch to 6 inches; gravelly loam
- AB—6 to 10 inches; gravelly loam
- Bt1—10 to 20 inches; clay loam
- Bt2—20 to 28 inches; clay loam
- Bt3—28 to 38 inches; gravelly clay
- Bt4—38 to 52 inches; gravelly clay

Bt5—52 to 67 inches; gravelly clay
Bt6—67 to 84 inches; gravelly clay

Minor Components in Map Unit 963

Surnuf soils with a subsoil of silty clay and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

Sites loam and similar soils
Composition: 5 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metasedimentary mountains
Hydric soil status: Not hydric

Soils that have a skeletal subsoil
Composition: 3 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

At an elevation of less than 2,800 feet, Surnuf soils on north-facing slopes and similar soils
Composition: 2 percent
Slope: 30 to 50 percent
Geomorphic position: Side slopes on metavolcanic and intrusive igneous mountains
Hydric soil status: Not hydric

990—Riverwash, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

General location: Sacramento and Feather River channels
Major uses: Wildlife habitat and watershed
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 75 to 170 feet (23 to 52 meters)
Mean annual precipitation: 21 to 23 inches (533 to 584 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 245 days

Map Unit Composition

Riverwash, frequently flooded—100 percent

Characteristics of Riverwash, Frequently Flooded

Slope: 0 to 2 percent
Geomorphic position: Gravel bars in river channels
Kind of material: Sandy and gravelly alluvium derived from igneous and metamorphic rocks
Surface runoff (bare conditions): Negligible
Altered hydrology: Flood-control structures have altered the natural frequency, duration, and periods of flooding.

Definition: Riverwash consists of unstable, recent alluvial deposits of stratified, sandy and gravelly sediments. It is flooded and reworked frequently by rivers.

991—Xerofluvents, 0 to 4 percent slopes, frequently flooded

Map Unit Setting

General location: Northwestern Butte County
Major uses: Wildlife habitat, watershed, and livestock grazing
Major land resource areas: 17 and 18
Landscape: Sacramento Valley and Southern Cascade foothills
Elevation: 140 to 4,435 feet (44 to 1,353 meters)
Mean annual precipitation: 23 to 70 inches (584 to 1,778 millimeters)
Mean annual air temperature: 50 to 63 degrees F (10 to 17 degrees C)
Frost-free period: 110 to 260 days

Map Unit Composition

Xerofluvents sandy loam, frequently flooded—75 percent
Minor components—25 percent

Characteristics of Xerofluvents Sandy Loam, Frequently Flooded

Slope: 0 to 4 percent
Geomorphic position: Bars and channels on flood plains
Parent material: Stratified, sandy and gravelly alluvium derived from igneous, metamorphic, and sedimentary rocks
Observed vegetation: California sycamore, white alder, Fremont cottonwood, valley oak, willows, foothill pine, California laurel, and Douglas sagewort
Surface feature: Bar-and-channel topography
Texture of the surface layer: Sandy loam
Percentage of the surface covered by rock fragments: 0 to 75 percent medium, rounded gravel, 0 to 40 percent rounded cobbles, 0 to 5 percent rounded stones
Restrictive feature: None identified
Shrink-swell potential: Low (LEP of less than 3)

Hydrologic properties (based on typical depth to a restrictive feature or 60 inches)
- *Annual flooding frequency:* Frequent
- *Annual ponding frequency:* None
- *Depth to a water table (zone of saturation):* 28 to 80 inches
- *Available water capacity:* Moderate (about 5.7 inches)
- *Natural drainage class:* Somewhat poorly drained
- *Surface runoff (bare conditions):* Negligible

Interpretive groups
- *Land capability, irrigated:* 6w-2
- *Land capability, nonirrigated:* 6w-2
- *Storie index:* 0 (revised)
- *Hydric soil status:* Not hydric
- *Hydrologic soil group:* A

Typical profile

A—0 to 6 inches; sandy loam
C1—6 to 14 inches; sandy loam
C2—14 to 26 inches; sandy loam
C3—26 to 37 inches; sandy loam
Ab—37 to 43 inches; sandy loam
C4—43 to 47 inches; loamy sand
C5—47 to 54 inches; sandy loam
C6—54 to 72 inches; loamy sand
C7—72 to 80 inches; sandy loam

Minor Components in Map Unit 991

Xerofluvents, frequently flooded for long periods, and similar soils
Composition: 13 percent
Slope: 0 to 4 percent
Geomorphic position: Channels on flood plains
Hydric soil status: Hydric

Charger fine sandy loam and similar soils
Composition: 6 percent
Slope: 0 to 4 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Vina fine sandy loam and similar soils
Composition: 3 percent
Slope: 0 to 4 percent
Geomorphic position: Alluvial fans
Hydric soil status: Not hydric

Xerofluvents with bedrock at a depth of less than 60 inches and similar soils
Composition: 3 percent
Slope: 0 to 4 percent
Geomorphic position: Bars and channels on flood plains
Hydric soil status: Not hydric

995—Pits, gravel

Map Unit Setting

General location: Western Butte County
Major uses: Source of aggregate and wildlife habitat
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 130 to 295 feet (40 to 91 meters)
Mean annual precipitation: 22 to 26 inches (559 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Pits, gravel—100 percent

Characteristics of Pits, Gravel

Geomorphic position: Flood plains and fan terraces
Kind of material: Sandy and gravelly alluvium derived from igneous and metamorphic rocks
Definition: Gravel pits consist of open excavations from which soil has been removed. The underlying exposed deposits of sand and gravel are excavated and removed.

996—Dumps, excavated material

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and source of fill aggregate
Major land resource area: 17
Landscape: Sacramento Valley
Elevation: 130 to 295 feet (40 to 91 meters)
Mean annual precipitation: 22 to 26 inches (559 to 660 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 days

Map Unit Composition

Dumps, excavated material—100 percent

Characteristics of Dumps, Excavated Material

Geomorphic position: Intermediate terraces
Definition: Dumps, excavated material, occur as areas of smooth or uneven accumulations or piles of stockpiled waste rock excavated during construction of the Thermalito Power Canal.

997—Pits

Map Unit Setting

General location: Central Butte County
Major uses: Wildlife habitat and recreation
Major land resource area: 17
Landscape: Sacramento Valley and Northern Sierra Nevada foothills
Elevation: 130 to 1,650 feet (40 to 503 meters)
Mean annual precipitation: 22 to 35 inches (559 to 889 millimeters)
Mean annual air temperature: 61 to 63 degrees F (16 to 17 degrees C)
Frost-free period: 250 to 260 days

Map Unit Composition

Pits—95 percent
Minor components—5 percent

Characteristics of Pits

Slope: 0 to 200 percent
Geomorphic position: Metamorphic and sedimentary hills and intermediate terraces
Definition: Pits consist of open excavations from which soil and, commonly, the

underlying material have been removed, exposing rock or other material. The remaining areas are associated with construction of the Oroville Dam, the Thermalito Power Canal, the Oroville Diversion Dam, and the fish barrier dam in the Oroville area and with mining at the Cherokee Gold Mine.

Minor Components in Map Unit 997

Rock outcrop
Composition: 3 percent
Slope: 0 to 200 percent
Geomorphic position: Metavolcanic hills

Cliffs
Composition: 2 percent
Slope: 150 to 200 percent
Geomorphic position: Terraces

998—Dumps, landfill

Map Unit Setting

General location: Central Butte County
Major use: Garbage disposal
Major land resource area: 18
Landscape: Southern Cascade foothills
Elevation: 225 to 415 feet (70 to 128 meters)
Mean annual precipitation: 26 inches (660 millimeters)
Mean annual air temperature: 61 degrees F (16 degrees C)
Frost-free period: 250 days

Map Unit Composition

Dumps, landfill—100 percent

Characteristics of Dumps, Landfill

Geomorphic position: The top and side slope of volcanic ridges
Definition: Dumps, landfill, occur as smoothed or uneven accumulations or piles of general refuse and the associated adjoining areas where soil has been removed for landfill cover.

999—Water

Map Unit Setting

Major land resource areas: 17, 18, 22A, and 22B

Map Unit Composition

Water—100 percent

Characteristics of Water

Definition: A perennial water body that includes streams, rivers, lakes, and ponds. Pits and reservoirs that contain water also are mapped as water. The water polygons are delineated according to the aerial imagery used during compilation of maps, as water coverage may fluctuate throughout and among years. Water bodies that are too small or narrow are not delineated.

DAM—Dam

Map Unit Composition

Dam, manmade—100 percent

Characteristics of Dam, Manmade

Definition: A constructed barrier, together with any associated spillways and appurtenant works, across a watercourse or natural drainage area. It permanently impounds and stores water, traps sediment, and controls floodwater.

Use and Management of the Soils

This soil survey is an inventory and evaluation of the soils in the survey area. It can be used to adjust land uses to the limitations and potentials of natural resources and the environment. Also, it can help to prevent soil-related failures in land uses.

In preparing a soil survey, soil scientists, conservationists, engineers, and others collect extensive field data about the nature and behavioral characteristics of the soils. They collect data on erosion, droughtiness, flooding, and other factors that affect various soil uses and management. Field experience and collected data on soil properties and performance are used as a basis in predicting soil behavior.

Information in this section can be used to plan the use and management of soils for crops and pasture; as forestland; as sites for buildings, sanitary facilities, highways and other transportation systems, and parks and other recreational facilities; and as wildlife habitat. It can be used to identify the potentials and limitations of each soil for specific land uses and to help prevent construction failures caused by unfavorable soil properties.

Planners and others using soil survey information can evaluate the effect of specific land uses on productivity and on the environment in all or part of the survey area. The survey can help planners to maintain or create a land use pattern in harmony with the natural soil.

Contractors can use this survey to locate sources of gravel, sand, reclamation material, roadfill, and topsoil. They can use it to identify areas where bedrock, wetness, or very firm soil layers can cause difficulty in excavation.

Health officials, highway officials, engineers, and others may also find this survey useful. The survey can help them plan the safe disposal of wastes and locate sites for pavements, sidewalks, campgrounds, playgrounds, lawns, and trees and shrubs.

Interpretive Ratings

The interpretive tables in this survey rate the soils in the survey area for various uses. Many of the tables identify the limitations that affect specified uses and indicate the severity of those limitations. The ratings in these tables are both verbal and numerical.

Rating Class Terms

Rating classes are expressed in the tables in terms that indicate the extent to which the soils are limited by all of the soil features that affect a specified use or in terms that indicate the suitability of the soils for the use. Thus, the tables may show limitation classes or suitability classes. Terms for the limitation classes are *not limited, somewhat limited,* and *very limited*. The suitability ratings are expressed as *well suited, moderately suited, poorly suited,* and *unsuited* or as *good, fair,* and *poor*.

Numerical Ratings

Numerical ratings in the tables indicate the relative severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.00 to 1.00. They indicate

gradations between the point at which a soil feature has the greatest negative impact on the use and the point at which the soil feature is not a limitation. The limitations appear in order from the most limiting to the least limiting. Thus, if more than one limitation is identified, the most severe limitation is listed first and the least severe one is listed last.

Land Capability Classification

Land capability classification shows, in a general way, the suitability of soils for most kinds of field crops. Crops that require special management are excluded. The soils are grouped according to their limitations for field crops, the risk of damage if they are used for crops, and the way they respond to management. The criteria used in grouping the soils do not include major and generally expensive landforming that would change slope, depth, or other characteristics of the soils, nor do they include possible but unlikely major reclamation projects. Capability classification is not a substitute for interpretations designed to show suitability and limitations of groups of soils for rangeland, for forestland, or for engineering purposes.

In the capability system, soils are generally grouped at three levels—capability class, subclass, and unit (USDA, 1961).

Capability classes, the broadest groups, are designated by the numbers 1 through 8. The numbers indicate progressively greater limitations and narrower choices for practical use. The classes are defined as follows:

Class 1 soils have slight limitations that restrict their use.

Class 2 soils have moderate limitations that restrict the choice of plants or that require moderate conservation practices.

Class 3 soils have severe limitations that restrict the choice of plants or that require special conservation practices, or both.

Class 4 soils have very severe limitations that restrict the choice of plants or that require very careful management, or both.

Class 5 soils are subject to little or no erosion but have other limitations, impractical to remove, that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 6 soils have severe limitations that make them generally unsuitable for cultivation and that restrict their use mainly to pasture, rangeland, forestland, or wildlife habitat.

Class 7 soils have very severe limitations that make them unsuitable for cultivation and that restrict their use mainly to grazing, forestland, or wildlife habitat.

Class 8 soils and miscellaneous areas have limitations that preclude commercial plant production and that restrict their use to recreational purposes, wildlife habitat, watershed, or esthetic purposes.

Capability subclasses are soil groups within one class. They are designated by adding a small letter, *e, w, s,* or *c,* to the class numeral, for example, 2e. The letter *e* shows that erosion is the main hazard affecting the use of the soils. The letter *w* shows that excess water is the main limitation affecting the use of the soils. Poor soil drainage, wetness, a high water table, ponding, and overflow are the factors that affect the soils in this subclass. The letter *s* shows that the soil is shallow or has other limitations within the root zone, such as rock fragments, limited available water capacity, low fertility that is difficult to correct, and salinity or sodium content. The letter *c* shows that the climate is the major limitation affecting the soils.

In class 1 there are no subclasses because the soils of this class have few limitations. Class 5 contains only the subclasses indicated by *w, s,* or *c* because the soils in class 5 are subject to little or no erosion. Class 8 does not include subclasses.

Capability units are soil groups within a subclass. The soils in a capability unit have similar potentials and limitations and require similar management. Capability units are

generally designated by adding an Arabic numeral to the subclass symbol, for example, 2e-4 and 3e-6.

Table 5 lists the capability classification of the soils and miscellaneous areas in this survey area. This information is also provided in the section “Detailed Soil Map Units.”

Major Land Resource Areas

Prepared by Jennifer Anderson, Soil Scientist, Natural Resources Conservation Service, Chico, California.

A major land resource area (MLRA) is a broad geographic area that has a distinct combination of climate, topography, vegetation, land use, and general type of farming (USDA, 2006). Parts of four of these nationally designated areas are in this survey area. These areas and their numbers are Sacramento and San Joaquin Valleys, MLRA 17; Sierra Nevada Foothills, MLRA 18; Sierra Nevada Mountains, MLRA 22A; and Southern Cascade Mountains, MLRA 22B. The major land resource area number is given in the detailed soil map unit descriptions.

MLRA 17, Sacramento and San Joaquin Valleys.—About one-third of the survey area is included in MLRA 17. Locally referred to as the Central Valley, this area includes the Sacramento and San Joaquin Rivers and is characterized by the influence of alluvial processes, including sediment transport, deposition, sorting, and development. These processes have created distinct landforms that guide land use. For instance, the processes formed the valley basins adjacent to the rivers, fans, and flood plains around tributary streams and the terraces and foothills around the valley edges.

The deepest, oldest sediments in the Central Valley came from the early Sierra Nevada volcanoes and were deposited in a marine environment. More recent sediments that were deposited in a nonmarine environment came from the Sierra Nevada Batholith granites, which were exposed upon weathering of the volcanoes. Most of this major land resource area’s surface has been covered by recent alluvial sediments, which exhibit various patterns of sediment deposition. The finer grained sediments occur in connection with flood plains, lakes, and basins; the coarser grained sands and gravel occur in connection with alluvial fans and stream channels; and gravelly stream terrace remnants occur along the edges of valleys.

Elevation ranges from sea level to 660 feet (200 meters) above sea level. The average annual precipitation is 12 to 30 inches (305 to 760 mm) in most of the Sacramento Valley, reaching 40 inches (1,015 mm) at the higher edges of the valley’s north end. The average annual precipitation in the San Joaquin Valley ranges from 5 to 12 inches (125 to 305 mm). The average annual temperature in this MLRA is 59 to 67 degrees F (15 to 20 degrees C), and the average annual freeze-free period is 325 days.

Because of low rainfall and low streamflow, water is scarce in many parts of this area. Irrigation for crops is obtained through stream diversions, wells, and canals of irrigation districts, which obtain their water from State and Federal water systems. The Sacramento and Feather Rivers supply most of the water used in the area.

Vegetation includes naturalized annuals and wild grains, scattered oaks on terraces, and oak, willow, and cottonwood along rivers and streams. Parts of the area are very important for wintering waterfowl and seasonally neotropical migrants.

About 58 percent of the land in this area is used for crops, mainly cotton, nuts, grapes, grains, hay, pasture, rice, alfalfa, citrus, and tomatoes in irrigated areas. The acreage used for urban development is increasing.

MLRA 18, Sierra Nevada Foothills.—About one-third of the survey area is included in MLRA 18. This MLRA is at the toe of the gentle east-west slope on the west side of the Sierra Nevada Mountains. The area consists of rolling to steep, dissected hills and low mountains. The northernmost part of the area is underlain dominantly by

pyroclastic rocks and volcanic mudflow of the Tuscan Formation, which formed from eruptions of volcanoes in the Cascade Range. To the south, metamorphosed marine sedimentary and volcanic rocks underlie this area; granites of the Sierra Nevada Batholith underlie the foothills around Merced and southward.

Elevation generally ranges from 660 to 1,650 feet (200 to 505 meters) but can be as much as 3,950 feet (1,205 meters) on isolated peaks. The average annual precipitation is 18 to 45 inches (455 to 1,145 millimeters), and the average annual temperature is 47 to 67 degrees F (8 to 20 degrees C). The average annual freeze-free period is 275 days.

Surface water in this area is generally of very high quality, requiring little or no treatment before use. Ground water supplies are small and mostly untapped. Vegetation includes naturalized annual grasses, shrubs, and trees. Grassland species consist dominantly of soft chess, wild oats, filaree, burclover, ripgut brome, and foxtail fescue. Scrub live oak, blue oak, and foothill pine occur as individual trees or in stands. Chamise and manzanita dominate areas of brushland, and ponderosa pine, manzanita, and black oak occur at the higher elevations.

More 60 percent of this area is grassland used mainly as rangeland for livestock production. A significant acreage of the area is brushland or openland hardwood forest, and only a small acreage is used as cropland.

MLRA 22A, Sierra Nevada Mountains.—About a one-sixth of the survey area is included in MLRA 22A. The higher elevations of the asymmetrical Sierra Nevada Mountains, with their steep eastern escarpment and gently sloping western slopes, make up this major land resource area. This area is characterized by hilly to steep mountain relief and mountain valleys, dominantly shaped by glaciers. The fingerprints of the glacial history in this area includes U-shaped valleys, scoured-out cirques, glacial till, and intermontane valleys filled with coarse grained alluvial deposits. Volcanic activity of minor extent produced lava flows in this area.

Elevation generally ranges from 1,500 to 9,000 feet (455 to 2,745 meters); some peaks exceed 12,000 feet (3,660 meters). The average annual precipitation is 40 to 80 inches (1,015 to 2,030 millimeters) in this area, with extremes of 6 inches (150 millimeters) in the foothills and lower valleys and as much as 100 inches (2,540 millimeters) on mountain peaks. Much of the winter precipitation occurs as snow. The average annual temperature is 25 to 63 degrees F (-4 to 17 degrees C), and the average annual freeze-free period is 205 days.

The abundant rainfall and snowfields on the higher mountain slopes supply the water needed to support forest and rangeland and help to meet the water needs of the lower areas by contributing to many perennial rivers. The main coniferous forest vegetation in this area is ponderosa pine, Douglas-fir, incense cedar, sugar pine, white fir, California red fir, Jeffrey pine, lodgepole pine, and mountain hemlock. Understory species in open stands include manzanita, sagebrush, blue wildrye, and bluegrasses. About three-fourths of this area is federally owned and is in national parks and forests. The rest consists of privately owned ranches, farms, and forestland. About 83 percent of the area is forestland and is used for recreation, wildlife habitat, timber production, and watershed. Less than 10 percent of the area is used as rangeland, and very little of the area is cropland.

MLRA 22B, Southern Cascade Mountains.—About one-sixth of the survey area is included in MLRA 22B. This MLRA covers the southernmost area of the north- to south-trending Cascade Mountain Range. It is made up primarily of volcanics, which are exposed as peaks and volcanic uplands. It is surrounded by cinder cones, shield volcanoes, and composite volcanoes. Well known peaks and recently active volcanoes in this area include Medicine Lake Volcano, Mount Lassen, and Mount Shasta. Alluvial, lacustrine, and fluvial deposits have collected in the depressions on lava flows, between lava flows, and in stream valleys and basins.

The average annual precipitation is 15 to 80 inches (380 to 2,030 millimeters). It occurs mainly as snow. The average annual temperature is 33 to 62 degrees F (1 to 17 degrees C), and average annual freeze-free period is 215 days.

The abundant rainfall and snowfields on the higher mountain slopes supply the water needed to support forest and rangeland and help to meet the water needs of lower areas by contributing to perennial streams. The surface water in this area is of high quality. The use of ground water is minimal.

Three main types of vegetation occur in this area. These are low-elevation mixed conifer forests consisting of ponderosa pine, incense cedar, and California black oak; higher elevation conifer forests consisting of white fir, sugar pine, ponderosa pine, incense cedar, Douglas-fir, California black oak, and Oregon white oak on the western slopes and Jeffrey pine and ponderosa pine on the eastern slopes; and at the higher elevations, upper montane forests consisting of red fir and lodgepole pine. Meadows occur throughout the forested areas.

Federally owned land occurring mainly as national forests makes up more than half of this area. The remaining land consists of privately owned ranches, farms, and forestland. About 72 percent of the area consists of forests, which are used for wildlife habitat, recreation, timber production, and watershed, and about 17 percent is rangeland. Only about 2 percent of the area is used as cropland.

Prime Farmland and Other Important Farmlands

In an effort to identify the extent and location of important farmlands, the Natural Resources Conservation Service, in cooperation with other interested Federal, State, and local government organizations, has inventoried land that can be used for the production of the Nation's food supply.

Prime farmland is of major importance in meeting the Nation's short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation's prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil quality, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied. In general, prime farmland has an adequate and dependable supply of moisture from precipitation or irrigation, a favorable temperature and growing season, acceptable acidity or alkalinity, an acceptable salt and sodium content, and few or no rocks. The water supply is dependable and of adequate quality. Prime farmland is permeable to water and air. It is not excessively erodible or saturated with water for long periods, and it either is not frequently flooded during the growing season or is protected from flooding. Slope ranges mainly from 0 to 6 percent. More detailed information about the criteria for prime farmland is available at the local office of the Natural Resources Conservation Service.

A recent trend in land use in some areas has been the loss of some prime farmland to industrial and urban uses. The loss of prime farmland to other uses puts pressure on marginal lands, which generally are more erodible, droughty, and less productive and cannot be easily cultivated.

About 240,800 acres in the survey area, or nearly 26 percent of the total acreage, meets the criteria for prime farmland. Most of the acreage designated as prime farmland is used to produce rice, almonds, walnuts, and dried plums.

The map units in the survey area that are considered prime farmland are listed in table 6. This list does not constitute a recommendation for a particular land use. On some soils included in the list, measures that overcome a hazard or limitation, such as flooding, wetness, and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures.

In some areas, land that does not meet the criteria for prime farmland is considered to be *farmland of statewide importance* for the production of food, feed, fiber, forage, and oilseed crops. The criteria for defining and delineating farmland of statewide importance are determined by the appropriate State agencies. Generally, this land includes areas of soils that nearly meet the requirements for prime farmland and that economically produce high yields of crops when treated and managed according to acceptable farming methods. Some areas may produce as high a yield as prime farmland if conditions are favorable. Farmland of statewide importance may include tracts of land that have been designated for agriculture by State law.

About 56,000 acres in the survey area, or about 6 percent of the total acreage, meets the criteria for farmland of statewide importance. Most of this acreage is used to produce grain, pasture, hay, orchard crops, or grapes.

The map units in the survey area that are considered farmland of statewide importance are listed in table 7. This list does not constitute a recommendation for a particular land use. On some soils included in the list, measures that overcome a hazard or limitation, such as flooding, wetness, and droughtiness, are needed. Onsite evaluation is needed to determine whether or not the hazard or limitation has been overcome by corrective measures.

The extent of the map units that are considered prime farmland or farmland of statewide importance is shown in table 4. The location is shown on the detailed soil maps. The soil qualities that affect use and management are described under the heading “Detailed Soil Map Units.”

Storie Index

Prepared by Anthony “Toby” O’Geen, Ph.D., Soils Extension Specialist, University of California, Davis, and Susan Southard, Soil Scientist, Natural Resources Conservation Service.

The Storie index is a widely known and accepted method of rating soils for land use and productivity in California (Storie, 1978). Ratings are generated from a broad range of soil profile and landscape characteristics. The Storie index of the soils in this survey area is shown in table 8 and in the descriptions of the detailed soil map units. Historically, Storie index ratings have been “hand generated” by soil survey staff and collaborators. These ratings can be highly subjective because no single person has generated them for the entire State and because there are inherent biases associated with the classification system. To reduce this subjectivity, a revised Storie index is used in the National Soils Information System (NASIS) to compute the ratings.

The model uses combinations of discrete and fuzzy logic functions (Cox, 1999) to obtain scores for the factors associated with the Storie index. If the modeled criteria in NASIS are used, subjectivity can be minimized and ratings can be generated in a timely and consistent manner.

The Storie index assesses the productivity of a soil on the basis of four factors. These are factor A, the degree of soil profile development; factor B, texture of the surface horizon; factor C, slope; and factor X, manageable features, including drainage, microrelief, fertility, acidity, erosion, and salt content. A score ranging from 0 to 100 percent is determined for each factor, and the scores are then multiplied together to derive an index rating (Storie, 1933, 1978). For map units with more than

one major component, the Storie index can be a weighted average based on the percentages of the soil components in the unit, the rating can be based solely on the major soil component, or it can be the best rating in the map unit.

For *factor A*, the degree of soil development is used to assess potential productivity. For alluvial soils, the score is progressively decreased with increasing degree of soil development and/or the presence of root-restrictive layers. Deep, well drained alluvial soils would be rated 100, whereas a similar soil with a restrictive horizon, such as a claypan or hardpan, would be rated much lower. For soils that formed in material weathered from bedrock, scoring is based on depth to lithic or paralithic contact.

Two main data sets in NASIS are used to model factor A, soil taxonomy and landform. Interpretive criteria implied in the Storie Profile Group (factor A) relied on the current taxonomic placement (Soil Survey Staff, 1999) of the soil in NASIS. In all situations, the upper limit of the scoring range was used for each soil profile group. For example, an Entisol that formed on the valley floor would be rated 100, whereas a Durixeralf that is on an old terrace and is less than 1 foot deep to a pan would receive a rating of 80. For depth to a restrictive layer, the fuzzy logic rule "more is better" was used to revise the upper limit of the score.

Factor B is based on texture of the surface horizon. Loamy soils receive the highest ratings, and clay-rich and sandy soils receive lower ratings. The scores are modified by the content of rock fragments. They range from 100 to 10 percent.

Crisp values were assigned for surface horizon textural classes according to Storie (1978). The following textures were not listed in the original Storie index publication and were added and assigned ratings by the authors: silty clay, clay, coarse sand, very fine sandy loam, sandy clay, loamy coarse sand, loamy fine sand, loamy very fine sand, and silt. At the present time, the NASIS Storie model does not rate in-lieu-of-textures because they were not addressed in the original Storie index. The content of rock fragments modified textural class ratings according to the fuzzy logic rule "less is better." The fuzzy score for content of rock fragments was used to weight the surface soil textural class score for factor B. For example, a silt loam with 0 percent rock fragments received a score of 100, while a very gravelly silt loam with 45 percent rock fragments received a score weighted proportionally to the content of rock fragments.

Factor C is based on steepness of slope. Scores are 100 to 85 percent if slopes are nearly level or gently sloping (0 to 8 percent), 95 to 70 percent if slopes are moderately sloping or strongly sloping (9 to 30 percent), and 50 to 5 percent if slopes are steep (more than 30 percent).

When slope classes stored in NASIS were scored, the fuzzy logic rule "less is better" was used. This function reduced the subjectivity associated with choosing a score from the range of scores within each factor. For example, the original Storie factor C (slope) has slope categories with scores that range from 100 for nearly level to 5 for very steep (Storie, 1978).

Factor X focuses on soil and landscape characteristics, exclusive of the soil profile, that require special management. The characteristics considered are fertility, drainage, erosion, acidity, salt content, and microrelief.

Data elements stored in NASIS, such as drainage class, erosion class, microrelief, flooding, and ponding, were used to model the hydrologic and physical properties associated with the X factor. Toxic thresholds were established for electrical conductivity, sodium adsorption ratio, and pH to define adverse chemical properties used for the X factor. Optimum soil pH was used to characterize fertility. Fuzzy rule sets were implemented in NASIS to model chemical and fertility attributes associated with the X factor. A "less is better" curve was used to score erosion and salt content. Crisp values were assigned to hydrologic properties.

Named components in map units are assigned grades according to their suitability for general intensive agriculture as shown by their Storie index ratings. The six grades and their range in index ratings are:

Grade 1—80 to 100
Grade 2—60 to 79
Grade 3—40 to 59
Grade 4—20 to 39
Grade 5—10 to 19
Grade 6—less than 10

Grade 1 soils are well suited to intensively grown irrigated crops that are climatically adapted to the region.

Grade 2 soils are good agricultural soils, although they are not so desirable as soils in grade 1 because of a less permeable subsoil, deep cemented layers (e.g., duripans), a gravelly or moderately fine textured surface layer, moderate or strong slopes, restricted drainage, a low available water capacity, lower soil fertility, or a slight or moderate hazard of flooding.

Grade 3 soils are only fairly well suited to agriculture because of moderate soil depth; moderate to steep slopes; restricted permeability in the subsoil; a clayey, sandy, or gravelly surface layer; somewhat restricted drainage; acidity; low fertility; or a hazard of flooding.

Grade 4 soils are poorly suited. They are more limited in their agricultural potential than the soils in grade 3 because of such restrictions as a shallower depth; steeper slopes; poorer drainage; a less permeable subsoil; a gravelly, sandy, or clayey surface layer; channeled or hummocky microrelief; or acidity.

Grade 5 soils are very poorly suited to agriculture and are seldom cultivated. They are more commonly used as pasture, rangeland, or woodland.

Grade 6 soils and miscellaneous areas are not suited to agriculture because of very severe or extreme limitations. They are better suited to limited use as rangeland, protective habitat, woodland, or watershed.

Important note: This interpretation was not designed to be used in a regulatory manner.

Hydric Soils

Table 9 lists the map unit components that are rated as hydric soils in the survey area. This list can help in planning land uses; however, onsite investigation is recommended to determine the hydric soils on a specific site (National Research Council, 1995; Hurt and others, 2002).

The three essential characteristics of wetlands are hydrophytic vegetation, hydric soils, and wetland hydrology (Cowardin and others, 1979; U.S. Army Corps of Engineers, 1987; National Research Council, 1995; Tiner, 1985). Criteria for all of the characteristics must be met for areas to be identified as wetlands. Undrained hydric soils that have natural vegetation should support a dominant population of ecological wetland plant species. Hydric soils that have been converted to other uses should be capable of being restored to wetlands.

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). These soils, under natural conditions, are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2003) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and others, 2002).

Hydric soils are identified by examining and describing the soil to a depth of about 20 inches. This depth may be greater if determination of an appropriate indicator so requires. It is always recommended that soils be excavated and described to the depth necessary for an understanding of the redoximorphic processes. Then, using the completed soil descriptions, soil scientists can compare the soil features required by each indicator and specify which indicators have been matched with the conditions observed in the soil. The soil can be identified as a hydric soil if at least one of the approved indicators is present.

Map units that are dominantly made up of hydric soils may have small areas, or inclusions, of nonhydric soils in the higher positions on the landform, and map units dominantly made up of nonhydric soils may have inclusions of hydric soils in the lower positions on the landform.

The criteria for hydric soils are represented by codes in the table (for example, 2B3). Definitions for the codes are as follows:

1. All Histels except for Folistels, and Histosols except for Folists.
2. Soils in Aquic suborders, great groups, or subgroups, Albolls suborder, Historthels great group, Histoturbels great group, Pachic subgroups, or Cumulic subgroups that:
   A. are somewhat poorly drained and have a water table at the surface (0.0 feet) during the growing season, or
   B. are poorly drained or very poorly drained and have either:
      1) a water table at the surface (0.0 feet) during the growing season if textures are coarse sand, sand, or fine sand in all layers within a depth of 20 inches, or
      2) a water table at a depth of 0.5 foot or less during the growing season if permeability is equal to or greater than 6.0 in/hr in all layers within a depth of 20 inches, or
      3) a water table at a depth of 1.0 foot or less during the growing season if permeability is less than 6.0 in/hr in any layer within a depth of 20 inches.
3. Soils that are frequently ponded for long or very long duration during the growing season.
4. Soils that are frequently flooded for long or very long duration during the growing season.

Forestland Productivity and Management

The tables described in this section can help forest owners or managers plan the use of soils for wood crops. They show the potential productivity of the soils for wood crops and rate the soils according to the limitations that affect various aspects of

forestland management. Only the soils that have the potential to produce wood crops are listed.

Forestland Productivity

In table 10, the *potential productivity* of merchantable or *common trees* on a soil is expressed as a site index and as a volume number. The *site index* is the average height, in feet, that dominant and codominant trees of a given species attain in a specified number of years. The site index applies to fully stocked, even-aged, unmanaged stands. Commonly grown trees are those that forest managers generally favor in intermediate or improvement cuttings. They are selected on the basis of growth rate, quality, value, and marketability. *Site index base,* given as a number, refers to the site index curve used to determine the productivity. The site index bases used are from the National Register of Site Index Curves. They are as follows: 30—Schumacher, 1926; 50—Schumacher, 1928; 600—Meyer, 1938; 605—Dunning, 1942; and 790—McArdle, Meyer, and Bruce, 1961. More detailed information about site index and site index bases is available in the "National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet.

The *annual production*, a number, is the yield likely to be produced by the most important tree species. This number, expressed as cubic feet per acre per year and calculated at the age of culmination of the mean annual increment (CMAI), indicates the amount of fiber produced in a fully stocked, even-aged, unmanaged stand.

Trees to manage are those that are preferred for planting, seeding, or natural regeneration and those that remain in the stand after thinning or partial harvest.

Forestland Management

In the tables described in this section, interpretive ratings are given for various aspects of forestland management. The ratings are both verbal and numerical.

Some rating class terms indicate the degree to which the soils are suited to a specified aspect of forestland management. *Well suited* indicates that the soil has features that are favorable for the specified management aspect and has no limitations. Good performance can be expected, and little or no maintenance is needed. *Moderately suited* indicates that the soil has features that are moderately favorable for the specified management aspect. One or more soil properties are less than desirable, and fair performance can be expected. Some maintenance is needed. *Poorly suited* indicates that the soil has one or more properties that are unfavorable for the specified management aspect. Overcoming the unfavorable properties requires special design, extra maintenance, and costly alteration. *Unsuited* indicates that the expected performance of the soil is unacceptable for the specified management aspect or that extreme measures are needed to overcome the undesirable soil properties.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the specified aspect of forestland management (1.00) and the point at which the soil feature is not a limitation (0.00).

Rating class terms for fire damage and seedling mortality are expressed as *low, moderate,* and *high*. Where these terms are used, the numerical ratings indicate gradations between the point at which the potential for fire damage or seedling mortality is highest (1.00) and the point at which the potential is lowest (0.00).

The paragraphs that follow indicate the soil properties considered in rating the soils. More detailed information about the criteria used in the ratings is available in the

"National Forestry Manual," which is available in local offices of the Natural Resources Conservation Service or on the Internet.

Table 11a

Ratings in the column *potential for damage to soil by fire* are based on texture of the surface layer, content of rock fragments and organic matter in the surface layer, thickness of the surface layer, and slope. The soils are described as having a low, moderate, or high potential for this kind of damage. The ratings indicate an evaluation of the potential impact of prescribed fires or wildfires that are intense enough to remove the duff layer and consume organic matter in the surface layer.

Ratings in the column *potential for seedling mortality* are based on flooding, ponding, depth to a water table, content of lime, reaction, salinity, available water capacity, soil moisture regime, soil temperature regime, aspect, and slope. The soils are described as having a low, moderate, or high potential for seedling mortality.

Table 11b

Ratings in the columns *suitability for hand planting* and *suitability for mechanical planting* are based on slope, depth to a restrictive layer, content of sand, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, moderately suited, poorly suited, or unsuited to these methods of planting. It is assumed that necessary site preparation is completed before seedlings are planted.

Ratings in the column *suitability for use of harvesting equipment* are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, and ponding. The soils are described as well suited, moderately suited, or poorly suited to this use.

Table 11c

Ratings in the column *suitability for mechanical site preparation (surface)* are based on slope, depth to a restrictive layer, plasticity index, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 1 foot is considered in the ratings.

Ratings in the column *suitability for mechanical site preparation (deep)* are based on slope, depth to a restrictive layer, rock fragments on or below the surface, depth to a water table, and ponding. The soils are described as well suited, poorly suited, or unsuited to this management activity. The part of the soil from the surface to a depth of about 3 feet is considered in the ratings.

Table 11d

Ratings in the column *hazard of off-road or off-trail erosion* are based on slope and on soil erodibility factor K. The soil loss is caused by sheet or rill erosion in off-road or off-trail areas where 50 to 75 percent of the surface has been exposed by logging, grazing, mining, or other kinds of disturbance. The hazard is described as slight, moderate, severe, or very severe. A rating of *slight* indicates that erosion is unlikely under ordinary climatic conditions; *moderate* indicates that some erosion is likely and that erosion-control measures may be needed; *severe* indicates that erosion is very likely and that erosion-control measures, including revegetation of bare areas, are advised; and *very severe* indicates that significant erosion is expected, loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical.

Ratings in the column *hazard of erosion on roads and trails* are based on the soil erodibility factor K, slope, and content of rock fragments. The ratings apply to unsurfaced roads and trails. The hazard is described as slight, moderate, or severe. A

rating of *slight* indicates that little or no erosion is likely; *moderate* indicates that some erosion is likely, that the roads or trails may require occasional maintenance, and that simple erosion-control measures are needed; and *severe* indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that costly erosion-control measures are needed.

Ratings in the column *suitability for roads (natural surface)* are based on slope, rock fragments on the surface, plasticity index, content of sand, the Unified classification, depth to a water table, ponding, flooding, and the hazard of soil slippage. The ratings indicate the suitability for using the natural surface of the soil for roads. The soils are described as well suited, moderately suited, or poorly suited to this use.

Characteristic Vegetation

In areas that have similar climate and topography, differences in the kind and amount of forestland vegetation are closely related to the kind of soil. Effective management is based on the relationships among soils, vegetation, and climate.

Management of vegetation requires knowledge of the kinds of soils and the potential natural plant communities on those soils. It also requires an evaluation of the present and desired condition trends for a given management area. The quantity and quality of understory vegetation in forests vary with the kind of soil, the age and kind of trees in the canopy, the density of the canopy, and the thickness and stage of decomposition of the litter. The density of the canopy determines the amount of light that understory plants receive.

Table 12 shows, for each soil that supports vegetation suitable for cropland, wildlife habitat, livestock grazing, or timber management, the commonly observed characteristic overstory and understory vegetation. Relative abundance as percent cover is shown for soils that are managed for timber production. The table provides information about vegetative relationships for specific soils. Data were collected following standard methods for areas that are managed for timber production. For all other areas, data are given for the commonly observed plants only.

Overstory vegetation more than 15 feet in height refers to the trees and shrubs that make up the canopy cover portion of the observed natural plant community on each soil. The common name and plant symbol are listed. The *percent cover by species* is the abundance, as a representative percentage of the total canopy cover, for each species that makes up the overstory portion of the characteristic vegetation. In agricultural areas, only the commonly occurring species are shown.

Understory vegetation less than 15 feet in height refers to the grasses, forbs, shrubs, and seedling trees that make up the understory portion of the observed natural plant community. The common name and plant symbol are listed. The *percent cover by species* is the abundance, as a representative percentage of the total understory, for each species that makes up the understory portion of the characteristic vegetation. If there is no associated canopy cover, the commonly observed plants are listed in the understory vegetation column.

Table 13 provides an index of the characteristic vegetation (common plant name, scientific plant name, and plant symbol) arranged in order by common plant name. Table 14 provides the same information arranged in order by plant symbol.

Wildlife Habitat

Prepared by Joseph G. Silveira, Wildlife Biologist, U.S. Fish and Wildlife Service, Sacramento National Wildlife Refuge Complex, Willows, California.

This survey area is characterized by a diversity of landforms, geology, soils, topography, hydrology, and climates, which result in various forms of vegetation (in areas of grassland, woodland, scrubland, chaparral, and mixed hardwood and

coniferous forests) and a rich diversity of natural plant communities and wildlife habitats. The flood plains along the Sacramento and Feather Rivers, Butte Basin, alluvial fans and terraces in the northern Sacramento Valley, and the Southern Cascade and Northern Sierra Nevada foothills and mountains are covered with a rich mosaic of vegetation and are dissected by streams, which provide water, food, cover, and breeding, migration, and wintering habitats for native fish, amphibians, reptiles, birds, and mammals.

Wildlife habitat is related to the soil landscape. The traditional definition of wildlife focused on birds (particularly waterfowl) and big game and fur-bearing animals, largely ignoring other vertebrate animals (fish, amphibians, reptiles, songbirds, and small mammals). Wildlife habitat was viewed in the context of wetlands, uplands, rangelands, and forests. The term "wildlife," however, implies all free-living organisms (Robinson and Bolen, 1989), including vertebrate and invertebrate fauna (animals) and flora (plants) living in both natural and managed wild lands.

The term "biodiversity" refers to living organisms (biota), their populations and assemblages (communities), while "natural diversity" refers to indigenous biota and the biological and geophysical processes (ecosystem) that sustain them. California wildlife habitats are described by specific vegetation or plant communities in the Wildlife Habitat Relationship Program (Mayer and Laudenslayer, 1988). Other classification systems are used specifically for vegetation, such as the current manual (Sawyer and Keeler-Wolf, 1995), which is under revision, and the former system (Holland, 1986), which is highly useful for describing valley and foothill habitats and understanding geophysical process, which affect vegetation patterns on the land. Other sources describe California vegetation in greater detail (Major and Barbour, 1988); exemplify its spectacular diversity (Faber, 1997); explore human impacts on the vegetation, landscape, and wildlife (Barbour and others, 1993; Thlander, 1994); and describe threats to, and opportunities for sustaining, California's biodiversity (California Department of Fish and Game, 2003). In a simplified, compact handbook, Storer and Usinger (1963) illustrate and describe a surprising amount of the biodiversity in Butte County.

Soil science is a key component of landscape ecology and must be considered for wildlife habitat restoration and management where the goal is to increase and sustain biodiversity. Landscape ecology is a sub-discipline of ecology that focuses on spatial and temporal variation through study of the relationships of physical elements and processes to patterns of energy flow, wildlife, and plant populations and communities (Forman and Gordon, 1986). This emerging science integrates climatology, hydrology, geology, geomorphology, soil science, vegetation and wildlife science, economics, sociology, law, engineering, and land use planning to conserve, enhance, restore, and protect the ecosystems on the land. Landscape ecology encompasses natural and human-influenced physical and biological features (patterns) and processes that shape the environment (U.S. Fish and Wildlife Service, 2005).

Over time (millions of years), the natural patterns of climate, hydrology, geology, soils, vegetation, and wildlife resulted in a rich natural diversity. Human cultural practices associated with modern civilization have drastically reduced the wildlife population and the extent of wildlife habitat and have greatly altered natural ecosystem processes, resulting in declining biodiversity. Presently, habitat loss (through agricultural and urban land use conversions) and invasive species continue to decrease the quantity and quality of wildlife habitat. Wildlife habitat restoration and management aim to restore and sustain certain levels of biodiversity.

Conservation and management of natural biodiversity involve maintaining environmental health and ecosystem stability. They increase the extent of native species (especially those indigenous to a particular site), endemic species (those that are known to occur only on a particular site), and rare, threatened, and endangered

species. Also, they decrease the extent of invasive species, which are a threat to natural diversity.

Use of local ecotypes for projects that enhance and restore wildlife habitat helps to maintain or increase natural diversity at a genetic level and helps to ensure restoration success because local ecotypes are adapted to local geophysical conditions. An ecotype is a population or group of populations of a particular species that is distinguished by unique morphological and/or physiological characteristics, infertile with other ecotypes and usually prevented from interbreeding with other ecotypes by ecological barriers (Barbour and others, 1987).

Rare species and species listed by the Federal Government and California as threatened and endangered occur throughout Butte County. State and federal laws pertain to certain land use practices that may impact endangered species. Migratory birds, such as waterfowl, shore birds, sandhill cranes, raptors, doves, and songbirds, and anadromous fish, such as sturgeon, Chinook salmon, and steelhead, move across State and national boundaries and are protected by Federal laws and policies enforced by the U.S. Fish and Wildlife Service and the National Oceanic and Atmospheric Administration. Resident species, such as quail, grouse, pheasant, wild turkey, rabbits, squirrels, black bear, mountain lion, wild pig, and deer, are protected by State laws and policies enforced by the California Department of Fish and Game. Lists of the wildlife in Butte County, including rare, threatened, and endangered species, are available from the California Department of Fish and Game and the U.S. Fish and Wildlife Service. Rare plants and plant conservation issues in California are well documented through a database-driven program (California Native Plant Society, 2001).

Social values affecting the conservation and management of natural diversity include recreation and education, which involve access to public lands and/or private clubs. Recreation involves wildlife-dependent activities, such as wildlife observation and photography, environmental education and interpretation, hunting and fishing, and hiking and camping (U.S. Fish and Wildlife Service, 2005). Butte County has many areas that offer opportunities for wildlife-dependent recreation and preservation of wildlife, including the Sacramento River National Wildlife Refuge, the Sacramento River Wildlife Area, Bidwell-Sacramento River State Park, the North Central Valley Wildlife Management Area (Llano Seco Unit), the Upper Butte Basin Wildlife Area, the Grey Lodge Wildlife Area, the Feather River Wildlife Area, the North Table Mountain Wildlife Area, the Coon Hollow Wildlife Area, the Big Chico Creek Ecological Preserve, the Butte Creek Canyon Ecological Preserve, the Butte Creek House Ecological Preserve, the Bechtel Stone Ridge Ranch Ecological Preserve, the Arroyo Chico Bidwell Ranch Preserve, Bidwell Park, Oroville Dam, the Plumas National Forest, and the Lassen National Forest. Increasing the quality and quantity of wildlife habitat can increase the opportunities for recreation and education and improve outdoor experiences related to public and private wildlife use.

Elements of wildlife habitat include water, food, and cover for rest, thermal regulation, and reproduction. Wildlife cover occurs in open environments, such as wetlands and grasslands and savannas (rangelands). It also occurs in open- to closed-canopy riparian and oak woodlands, hardwood-conifer and mixed conifer forests, and areas of chaparral. Food sources provide high-energy seeds and fruits and protein-rich grasses, legumes, herbaceous forbs, and leaves from woody plants. Wildlife species are selective throughout the year, reflecting their annual behavioral and physiological-energetic cycle (Raveling, 1979; Silveira, 1998; Taber and Dasmann, 1958). Herbaceous annual and perennial grasses and forbs, such as soft chess, annual ryegrass, wild oats, filaree, asters, mustards, lupines, and clovers (legumes), provide seeds for food and foliage for food and cover. Domestic crop grains, such as rice and wheat, also provide seeds and foliage for food and cover. Irrigated and dry pasture provides grasses and legumes. Trees and shrubs provide bark, branches, twigs, and foliage for food and cover and fruits, such as berries, acorns, and catkins,

for food. Coniferous plants provide cones for food and woody and green structure for cover. Soil properties affect plant growth and vigor and the distribution and patterns of vegetation; therefore, soils influence the nutritional and structural value of wildlife habitat.

Wetlands increase the diversity of wildlife habitat. They occur throughout Butte County as major riparian, marsh, and meadow habitat types or as spatial and/or temporal inclusions in the larger areas of other habitat types. There are a great variety of types of natural wetlands and species of wetland plants. Wetland plants are completely aquatic (submerged), partially aquatic (emergent, shoreline), or completely terrestrial. Wetlands consist of riparian (stream-side) flood plains, saturated meadows, shallow water intermittent pools and streams, and relatively permanent lakes. Intermittent wetlands form with cool-season rains in the valley and foothills and with rain and snowmelt in the mountains. Intermittent wetlands, such as vernal pools, are extremely productive and important for migratory birds and endangered species (Silveira, 1998). Besides wildlife habitat, wetlands provide temporary flood storage and improve water quality by filtering sediments. Wetland impoundments are constructed when depressions and channels are cut and levees, dams, and canals are built to hold and convey the water necessary to restore and manage habitat for waterfowl and other wildlife. Federal and State laws and policies apply to wetland construction and drainage. The U.S. Army Corp of Engineers and the California Department of Water Resources are enforcement agencies.

Soils are of fundamental importance to the conservation and management of wildlife habitat and must be considered before habitat restoration projects are implemented (Silveira and others, 2003). Riparian forests, freshwater wetlands, grasslands, woodlands, and forests occur in patterns that reflect geophysical features, such as geology, landforms, soils, topography, slope, surface and subsurface hydrology, and climate, as influenced by latitude and elevation. Soil properties, such as texture, depth to bedrock, a duripan, or gravel (restrictive layers), and chemistry, along with the landscape features (topography and slope), affect the growth and vigor of the plant species used by wildlife. Soils also affect the potential for habitat restoration and management.

Plant-soil relationships determine which species are adapted to specific site characteristics and conditions, ultimately determining vegetation and wildlife use (Silveira and others, 2003). It is important to restore and manage desirable wildlife habitat plants on suitable sites, that is, the sites to which the species are adapted. Invasive plant species, which decrease the quality and quantity of habitat, become extremely prolific and vigorous (weedy) in areas of highly productive, deep, well drained soils and less weedy in areas of saline-sodic, alkaline-acidic, and shallow soils. Therefore, soil properties affect the intensity of the vegetation management necessary to enhance and maintain wildlife habitat. Vegetation management, which includes grazing, burning, mowing, disking, applications of herbicide, and removal of invasive nonnative trees and shrubs, enhances and maintains wildlife habitat by directing plant succession to earlier, vigorous stages; improving the structure of wildlife cover; increasing plant digestibility and nutritional values; and decreasing the extent of undesirable weeds and invasive plants (Marty, 2005; Silveira, 1998).

Federal and State grants for wildlife habitat restoration projects on private and public lands are available through the U.S. Department of Agriculture, the U.S. Fish and Wildlife Service, the U.S. Bureau of Reclamation, the National Oceanic and Atmospheric Administration, the California Wildlife Conservation Board, and private organizations and foundations.

The relationship of landforms and soils to vegetation and wildlife habitat appears complex, but it can be comprehended with relative ease in obvious landscape patterns. Comparing the soil groups in this survey with those identified on the map in the “Reconnoissance Soil Survey of the Sacramento Valley, California” (USDA, 1915)

illustrates the enduring nature of these patterns. Soils develop in patterns across landforms (Smith and Verrill, 1998); plants grow in patterns strongly linked with soil groups and map units.

Plant-soil relationships affect the distribution and patterns of vegetation (Holland and Dains, 1990). Soil texture and profile development as they relate to the root zone of plants, depth to restrictive layers as it relates to root penetration and growth, the availability of water, and chemistry (salinity and sodicity and alkalinity and acidity) affect plant germination, plant growth and vigor, and ultimately the species that can survive in these edaphic (soil) conditions. The root zone is affected by the water-holding capacity, wetness, and permeability of the soils. Geology, landforms, soils, topographic features (such as depressions, swales, and slope), hydrology, and climate, as influenced by latitude, elevation, and slope aspect (which affects precipitation, minimum and maximum temperatures, cumulative heat days, frost days, and the snow line) affect the distribution of plant species, giving rise to various plant assemblages (plant communities), which are characterized by their plant species composition, frequency, density, and cover. The Butte County flora consists of more than 125 families, 676 genera, 1,890 species, and 133 varieties and subspecies, for a total of 2,023 plant taxa, which includes 458 non-natives and 77 plants listed by the California Native Plant Society as rare, threatened, or endangered in California and elsewhere (Oswald and Ahart, 1994). This flora occurs in 15 vegetation types described as California wildlife habitats (Mayer and Laudenslayer, 1988).

Charts A, B, and C and appendices A and B illustrate the relationship between the soils and wildlife habitats in the survey area. Following is a description of wildlife habitats (including selected wildlife species) within the context of soil-landscape groups from the survey. Refer to Major and Barbour (1988) for detailed descriptions of the vegetation.

Flood Plains Along the Sacramento and Feather Rivers

Valley and Foothill Riparian, Freshwater Marsh, Valley Oak Woodland, Annual Grassland, and walnut and almond orchards characterize the flood plains along the rivers in Butte County. In the Sacramento River meander belt portion of the flood plain, soils are young, coarse textured, very deep, and freely drained. In the meander belt, plant germination and growth and vegetation patterns are strongly affected by frequent overbank flooding, which results in scouring, erosion, and deposition. The flooding creates azonal layers of periodically reworked gravel, sand, and silt (mixed alluvium). While this portion of the flood plain is used for orchards, fragments of Valley Riparian Forest remain. This forest once dominated the area. River meander does not rework the stable portion of the flood plain, where the soils are older, medium textured, very deep, and well drained. This portion of the flood plain is affected by occasional flooding and is used for orchards, but it was historically dominated by Valley Oak Woodland. Germination patterns reflect ponding patterns, while seedling survival is dependent on depth to root-restricting gravel and the water table. Successful flood-plain and riparian habitat restoration must include detailed soil mapping to determine depth to the water table, which especially affects woody species survival and selection, and the presence of gravel, which limits root growth in woody species (Silveira and others, 2003).

Riparian and flood-plain wildlife habitats are characterized by a rich mosaic of vegetation, which forms closed- to open-canopy forests, woodlands, scrublands, and areas dominated by a variety of perennial and annual herbaceous plants. Forest and woodland understories range from relatively open areas of forbs, grasses, and sedges to impenetrable thickets of shrubs, blackberries, and vines.

Chart A.—Valley and Terrace Wildlife Habitats in Butte Area Soil Groups

General soil map unit	Kind of wildlife habitat						
	Valley & Foothill Riparian	Valley Oak Woodland	Fresh Emergent Wetland	Annual Grasdsland	Pasture	Cropland	Orchard-Vineyard

X indicates widespread distribution and/or dominant cover.
Z indicates limited distribution because of soil type or fire.

Riparian and flood-plain trees include:

arroyo willow
boxelder
California button-bush
Fremont's cottonwood
Goodding's black willow
Northern California black walnut (feral hybrids with commercial English walnut)
Oregon ash
sandbar willow
valley oak
western sycamore
white alder

Flood-plain shrubs include:

blue elderberry
California blackberry
California manroot
California pipevine
California rose
California wild grape
coyote-brush
Himalayan blackberry (invasive)
hoary creek nettle
mugwort
mule's fat
Oregon golden aster
rose mallow
virgin's bower
western goldenrod

Herbaceous flood-plain plants include:

alkali ryegrass (creeping wildrye)
American black nightshade
broad-leaved pepper-weed (invasive)
clustered field sedge
Johnson-grass (invasive)
ripgut brome
Santa Barbara sedge
sharp-leaved fluellin (invasive)
showy milkweed
Sonoma hedge-nettle
telegraph weed
thorn-apple
yellow star-thistle (invasive)
yellow water-weed (invasive)

Cut banks, sandbars, gravel bars, and gravel beds are used by wildlife for nesting and spawning. Cut banks along the Sacramento River support the largest bank swallow colonies in California.

Animals use riparian habitats as breeding and wintering areas and as migration corridors, where the wildlife moves among various valley, foothill, and mountain habitats, depending on the season and the annual behavioral and physiological-energetic cycle of the animals.

Fishes include:

American shad
California roach
Chinook salmon (winter run, spring run, fall and late fall run)
green sturgeon
hardhead
hitch
Pacific lamprey
prickly sculpin
riffle sculpin
river lamprey
Sacramento splittail
Sacramento sucker
Sacramento whitefish
speckled dace
steelhead
striped bass
threadfin shad
western brook lamprey
white sturgeon

Amphibians and reptiles include:

bullfrog
common garter snake
gopher snake
Pacific tree frog
slider
southern alligator lizard
western fence lizard
western pond turtle
western rattlesnake

Birds include:

acorn woodpecker
American goldfinch
American kestrel
American white pelican
Anna's hummingbird
ash-throated flycatcher
bald eagle
bank swallow
barn owl
belted kingfisher
Bewick's wren
black-chinned hummingbird
black-headed grosbeak
black phoebe
blue grosbeak
brown creeper
brown-headed cowbird
Bullock's oriole
bushtit
California quail
California towhee

Canada goose
Caspian tern
common goldeneye
common merganser
common moorhen
Cooper's hawk
double-crested cormorant
fox sparrow
great blue heron
great egret
great horned owl
hermit thrush
killdeer
lark sparrow
lazuli bunting
lesser goldfinch
lesser nighthawk
mallard
Nuttall's woodpecker
oak titmouse
orange-crowned warble
osprey
Pacific-slope flycatcher
purple finch
red-shouldered hawk
red-tailed hawk
ruby-crowned kinglet
song sparrow
spotted sandpiper
spotted towhee
Swainson's hawk
Swainson's thrush
tree swallow
turkey vulture
warbling vireo
western wood pewee
western yellow-billed cuckoo
white-breasted nuthatch
wild turkey
willow flycatcher
wood duck
yellow-breasted chat
yellow-rumped warbler
yellow warbler

Mammals include:

beaver
big free-tailed bat
black-tailed deer
bobacat
California myotis
California vole
coyote
Mexican free-tailed bat

mountain lion
pallid bat
porcupine
raccoon
red bat
ringtail
river otter
western gray squirrel
wild pig

Northeast Sacramento Valley Flood Basins

Annual Grassland, Freshwater Marsh, and rice paddies characterize these flood basins. Hydric soils dominate the basins. They are distinguished by saturation and anaerobic conditions, ponding, a high shrink-swell potential, deep cracking, and a high content of clay. Plant growth and survival are limited to species adapted to wetland conditions. Few soil-related limitations affect the creation of ponds on this landscape.

Flood-basin wildlife habitats occur as areas of open water, emergent marshes, grasslands, and rice fields. They are dissected by willow-lined creeks, sloughs, and canals. Flood-basin plants and waste grains from rice harvests provide vital wildlife food and cover.

Flood-basin wetland plants include:

arrowheads
bulrushes
burhead
cattails
hard-stemmed tule
Goodding's black willow
pale spike-rush
pondweeds
pricklegrass
sedges
smartweeds
smooth spike-primrose
square-stemmed spike-rush
swamp timothy
toad rush
water-grass
water-plantain

Goodding's black willow is adapted to and occurs in areas of clays and clay loams, typically adjacent to creeks, sloughs, canals, and ponds.

Flood-basin grassland plants include:

alkali-mallow
alkali ryegrass
annual ryegrass (dominant)
annual salt marsh aster
bindweed (invasive)
black mustard
blue wild-rye
broad-leaved pepper-weed (invasive)
California aster
clovers

common fiddleneck
common spikeweed
curly dock
double-horned downingia
dwarf pepper-grass
Ferris' milk-vetch (rare)
Johnson-grass (invasive)
lupines
meadow barley
milk-thistle
narrow-leaved milk-weed
red-flowered vetch
Scribner's grass
valley gumplant
water pygmyweed
yellow-rayed goldfields
wild radish

Mudflats form from drained marshes and rice fields. They provide vitally important feeding habitat for spring-staging shore birds.

Butte Basin and northeast Sacramento Valley wetlands provide vital winter and migration stopover habitats supporting some of the most abundant assemblages of migratory waterfowl in the valley. Peak populations reach 1.4 million ducks, geese, and swans, shore birds, and sandhill cranes. Canada goose, mallard, cinnamon teal, American bittern, white-faced ibis, red-tailed hawk, and northern harrier breed in flood-basin habitats.

Amphibians and reptiles include:

bullfrog
common garter snake
giant garter snake
gopher snake
western aquatic garter snake
western pond turtle
western yellow-bellied racer

Birds include:

American avocet
American bittern
American coot
American goldfinch
American pipit
American wigeon
bald eagle
black-bellied plover
black-crowned night heron
black-neck stilt
black tern
Brewer's blackbird
bufflehead
cackling goose
Canada goose
cinnamon teal
Clark's grebe
common yellowthroat

dowitchers
dunlin
eared-grebe
gadwall
grasshopper sparrow
great blue heron
great egret
great horned owl
greater yellowlegs
green bittern
green-winged teal
herring gull
killdeer
lark sparrow
least bittern
lesser goldfinch
Lincoln's sparrow
loggerhead shrike
long-billed curlew
mallard
marsh wren
northern harrier
northern pintail
northern shoveler
Pacific white-fronted goose
peregrine falcon
pied-billed grebe
redhead
red-tailed hawk
red-winged blackbird
ring-billed gull
ring-necked duck
ring-necked pheasant
Ross' goose
ruddy duck
sandhill cranes
sandpipers
savanna sparrow
semipalmated plover
sharp-shinned hawk
snow goose
snowy egret
song sparrow
sora
tricolored blackbird
tundra swan
Virgina rail
western grebe
western meadowlark
whimbrel
white-crowned sparrow
white-faced ibis
white-tailed kite
Wilson's phalarope

wood duck
yellow-headed blackbird
yellow-rumped warbler

Mammals include:

beaver
black-tailed jackrabbit
coyote
desert cottontail
muskrat
Norway rat

Northeast Sacramento Valley Alluvial Fans

Valley Oak Woodland and walnut and almond orchards distinguish the northeast Sacramento Valley alluvial fans. Valley Riparian Forest also provides wetland wildlife habitat. The soils are highly productive, deep, and well drained and have few limitations.

The valley alluvial fans are characterized by urban areas, almond and walnut orchards, and remnant stands of valley oak trees. Historically, Valley Oak Woodland dominated the alluvial fans, forming expansive closed-canopy woodlands to open savannas (with varying degrees of widely spaced oaks on the grassland). A large valley oak woodland remains in Chico.

Valley oak is the dominant tree. Common shrubs include:

blue elderberry
California blackberry
California wild rose
poison oak

Common herbaceous plants include:

annual ryegrass
black mustard
clovers
common fiddleneck
filarees
foxtail fescue
lupines
miner's lettuce
soft chess
wild radish
yellow star-thistle (invasive)

Animal species overlap with those on similar adjacent habitats on flood plains, terraces, and foothills.

Fishes include:

California roach
Chinook salmon (spring run)
hardhead
hitch
Pacific lamprey
prickly sculpin
rainbow trout
riffle sculpin

Sacramento sucker
Sacramento whitefish
speckled dace
steelhead

Amphibians and reptiles include:

common garter snake
gopher snake
western fence lizard
western skink
western toad

Birds include:

acorn woodpecker
American crow
American robin
barn owl
Bewick's wren
black-headed grosbeak
brown creeper
bushtit
California quail
Cooper's hawk
dark-eyed junco
European starling
fox sparrow
golden-crowned kinglet
great-horned owl
house finch
house sparrow
lark sparrow
mourning dove
northern mockingbird
oak titmouse
red-shouldered hawk
red-tailed hawk
ruby-crowned kinglet
sharp-shinned hawk
western kingbird
western screech-owl
western scrub jay
white-breasted nuthatch
white-crowned sparrow
yellow-billed magpie

Mammals include:

Botta's pocket gopher
black rat
California ground squirrel
coyote
deer mouse
feral house cat
gray fox
harvest mouse

house mouse
opossum
raccoon
striped skunk
Townsend mole
vagrant shrew
western gray squirrel

Southern Cascade and Northern Sierra Nevada Fan Terraces

Annual Grassland dominates this landscape, which also includes small areas of rice and almond and citrus orchards. The Southern Cascade Terrace gradually slopes from the foothills to the valley, while the Northern Sierra Nevada Fan Terraces form a rolling terrain. Mound-swale microtopography and ephemeral drainages occur throughout this landscape. The soils are very shallow to moderately deep, are underlain by a duripan, are seasonally saturated in winter by a high water table perched on the duripan, and are very dry in summer. These conditions limit plants to annual grasses and forbs and result in the extreme, alternating lush and harsh character of this landscape. Livestock grazing, particularly by cattle, plays a major role in the structure of grassland vegetation and may be used to improve native wildflower (forb) diversity and abundance and the quality and capacity of the wildlife habitat (Marty, 2005; Silveira, 1998). Prescribed fire can reduce the extent of medusa-head grass and improve the quality of livestock forage, native plant abundance, and wildlife habitat (Griggs, 2000).

Annual grasslands with vernal pools characterize the fan terraces. Vernal pools support a highly endemic flora and unique vegetation (Barbour and others, 2003; Holland and Dains, 1990). The plants in the vernal pools are considered wetland species and are specially adapted to survive the extreme conditions of the wet-dry cycle.

Vernal-pool plants include:

annual hairgrass
Butte County meadowfoam (rare)
cleistogamous spike-primrose
coyote-thistle
Douglas' pogogyne
dwarf wooly-marbles
folded downingia
Fremont's goldfields
Green's tuctoria (rare)
Oregon wooly-marbles
popcorn flowers
rosy meadowfoam
Sacramento Valley pogogyne
smooth goldfields
toothed downingia
tricolored monkey flower
valley vernal pool foxtail
water buttercup
white-flowered navarretia
white meadowfoam
white-tipped clover
wooly meadowfoam
yellow carpet

Grassland plants include:

annual ryegrass
bicolored lupine
bluedicks
Butte County golden clover (rare)
butter and eggs
field owl-clover
filarees
Fitch's spike-weed
Fremont's tidy tips
foxtail fescue
hayfield tarweed
lowland shooting-star
Menzies' fiddleneck
shining pepper-grass
soft chess
sticky tarweed
Tehama navarretia
veiny monardella (rare)
wild oats
yellow star-thistle (invasive)

Vernal pools are extremely productive wetlands that support an abundance of native invertebrates during wet, late winter and early spring periods. In fact, California vernal pools support the greatest diversity of fairy shrimp species per area on earth (Eriksen and Belk, 1999). Invertebrates and grasses are high-protein food sources for migratory waterfowl, shore birds, and sandhill cranes (Silveira, 1998).

Amphibians and reptiles include:

gopher snake
striped racer
western rattlesnake
western spadefoot

Birds include:

American kestrel
American pipit
American wigeon
burrowing owl
cackling goose
California horned lark
Canada goose
cliff swallow
golden eagle
greater yellowlegs
green-winged teal
killdeer
loggerhead shrike
long-billed curlew
mallard
mourning dove
northern pintail
prairie falcon
red-tailed hawk

sandhill cranes
savanna sparrow
short-eared owl
western bluebird
western meadowlark

Mammals include:

black-tailed jackrabbit
Botta's pocket gopher
California ground squirrel
coyote

Feather River Terraces

Valley Oak Woodland and fruit orchards characterize this landscape. Valley oak occurs in deep, well drained alluvial soils. The soils are productive, deep, and well drained and have few limitations.

Fruit, nut, and citrus orchards and scattered remnant stands of valley oak dominate the Feather River Terrace. Valley Oak Woodland, which formed closed-canopy stands to open savanna, historically dominated this landscape.

Common herbaceous plants include:

common fiddleneck
fillarees
foxtail fescue
miner's lettuce
soft chess
wild oats

Cut banks along the Feather River support limited colonies of bank swallows.

Animal species overlap with those on similar adjacent habitats on flood plains and alluvial fans.

Amphibians and reptiles include:

common snake
gopher snake
western toad

Birds include:

American crow
American goldfinch
American kestrel
American robin
Bullock's oriole
mourning dove
northern flicker
northern mockingbird
red-tailed hawk
white-crowned sparrow
yellow-billed magpie

Mammals include:

Botta's pocket gopher
California ground squirrel

coyote
townsend mole

Northern Sierra Nevada and Southern Cascade Foothills

Blue Oak Woodland, Blue Oak-Foothill Pine, Montane Hardwood Forest, and Mixed Chaparral dominate this landscape. Annual Grassland is limited to the lower elevations in blue oak savannas, and Chamise-Redshank Chaparral is limited to the Cohasset Ridge. Foothill Riparian Forest provides vital wetland wildlife habitat. Important soil characteristics, which affect plant growth and vigor and vegetation patterns, include depth to bedrock, content of rock fragments, available water capacity, slope, and parent material. The periodicity of wildfire plays a major role in plant succession and vegetation patch age and structure. Prescribed fire may be used to improve wildlife habitat (Taber and Dasmann, 1958) and provide protection from wildfire. Grazing to increase grassland diversity and the quality of wildlife habitat is a management consideration in Annual Grassland and Blue Oak Woodland habitats. Water developments for wildlife are limited by soil depth, slope, and the availability of water (seeps and springs) on upland sites.

An extremely rich and diverse mosaic of trees and shrubs characterizes foothill habitat, which forms open savannas to closed-canopy woodlands and open scrubland to interlocking shrub stands (chaparral). Woodland understory commonly forms dense, impenetrable thickets.

Foothill trees include:

bigleaf maple
blue oak (dominant)
California black oak
California buckeye
California laurel
canyon live oak (dominant)
Douglas-fir (higher elevations)
foothill pine (dominant)
incense cedar
interior live oak (dominant)
McNab cypress (ultramafic soils)
Oregon oak (limited)
Pacific madrone
ponderosa pine
redbud
valley oak (deeper soils)

Foothill shrubs include:

birch-leaved mountain-mahogany
buckbrush
bush monkey flower
California coffeeberry
California yerba santa
chamise
common manzanita
deerbrush
Fremont's silk-tassel
holly-leaf cherry
holly-leaf redberry
leather oak

Lemmon's ceanothus
poison oak
scrub oak
toyon
western spice bush
whiteleaf manzanita

Herbaceous annuals on foothills are similar to those on the Southern Cascade and Northern Sierra Nevada fan terraces. At the lower western margins, they also include:

bird's eye gilia
bitter-root
California goldfields
canyon dudleya
Douglas' violet
dwarf-stonecrop
foothill gumplant
foothill poppy
Indian paintbrush
Ithuriel's spear
jewel-flower
Kellogg's monkey-flower
lace-pod
Mariposa lily
Menzies' fiddleneck
mustang-mint
naked buckwheat
purple owl-clover
royal larkspur
seep monkey-flower
serpentine phacelia
Shasta meadowfoam
sky lupine
sticky navarretia
Table Mountain meadowfoam
tansy phacelia
white meadowfoam
wild onion
woodlandstar

Dazzling spring wildflower displays may occur on Table Mountain in years with germinating fall rains, mild winters, and above-average rainfall in late winter and early spring.

Outcrops of lava flows, volcanic mudflows, basalt and metavolcanic rock outcrops, and diorite, gabbro, and quartz rocks provide cover and sites for perching, basking, nesting.

Foothill habitats provide vital breeding, winter, and migration corridor-stopover habitats, which support the most diverse assemblage of abundant resident and migratory animals in Butte County. The combination of dense and/or multilayered vegetation with open vegetation provides the highest quality wildlife habitat in the foothills, a result of diverse structure and edge effect (the contact zone of two or more habitats). The best example is general soil map unit 25, where large stands of Mixed Chaparral interlace with patches of Annual Grassland on shallow soils. General soil map unit 18 has patterns of an annual grassland matrix with small groves and widely spaced or individual blue oaks (a savanna form of Blue Oak Woodland) and has

discrete stands of foothill pine, hardwood trees, and shrubs, which may also be widely spaced (Blue Oak-Foothill Pine).

Resident species move among the various kinds of wildlife habitat in the foothills and among the habitats in the adjacent valley and mountains.

Fishes include:

California roach
Chinook salmon (spring run)
hardhead
hitch
Pacific lamprey
prickly sculpin
rainbow trout
riffle sculpin
Sacramento sucker
Sacramento whitefish
speckled dace
steelhead

Amphibians and reptiles include:

California newt
California slender salamander
California whipsnake
coast horned-lizard
common garter snake
common kingsnake
ensatina
foothill yellow-legged frog
gopher snake
night snake
Pacific tree frog
red-legged frog
ringneck snake
rubber boa
sharp-tailed snake
southern alligator lizard
western fence lizard
western pond turtle
western rattlesnake
western skink
western spadefoot
western terrestrial garter snake
western whiptail
western yellow-bellied racer

Birds include:

American goldfinch
American kestrel
Anna's hummingbird
ash-throated flycatcher
band-tailed pigeon
black-chinned hummingbird

black-throated gray warbler
blue-gray gnatcatcher
bushtit
California quail
California thrasher
canyon wren
Cassin's vireo
cedar waxwing
chipping sparrow
common raven
downy woodpecker
dusky flycatcher
fox sparrow
golden eagle
lesser goldfinch
MacGillivray's warbler
mourning dove
Nashville warbler
Nuttall's woodpecker
oak titmouse
orange-crowned warbler
Pacific-slope flycatcher
phainopepla
prairie falcon
red-tailed hawk
savanna sparrow
Say's phoebe
turkey vulture
warbling vireo
western bluebird
western screech-owl
western scrub jay
western wood-pewee
white-breasted nuthatch
wild turkey

Mammals include:

black bear
black-tailed deer
bobcat
Botta's pocket gopher
California ground squirrel
California kangaroo rat
California myotis and other bats
coyote
deer mouse
gray fox
long-tailed weasel
mink
mountain lion
striped skunk
wild pig

Southern Cascade and Northern Sierra Nevada Mountains

Sierran Mixed Conifer forests dominate the Butte County mountain landscape as a multilayered, closed-canopy forest. Ponderosa Pine, Montane-Hardwood Conifer forests, and limited Montane Chaparral also occur on this landscape. Montane Riparian and Wet Meadow provide vital wetland wildlife habitat. Soils that formed in material weathered from serpentine and granite support unique stands of vegetation and many endemic plants (Faber, 1997). Depth to bedrock, texture, slope, and parent material affect plant growth and vigor and the distribution of vegetation. The periodicity of wildfire and commercial forestry practices affect forest stand age, structure, and succession. Water developments for wildlife are limited by soil depth, slope, and the availability of water (seeps and springs) on upland sites.

Dominant trees of coniferous forests include:

Douglas-fir
incense cedar
ponderosa pine
sugar pine
white fir

Ponderosa pine is abundant at the lower elevations and on south-facing slopes. Jeffery pine replaces ponderosa pine at the higher elevations and in ultramafic soils. Red fir occurs at the higher elevations, mixing with sugar pine and white fir.

Other forest trees include a mixture of (Hanson, 2003 and 2004):

bigleaf maple
California bay
California black oak
California hazelnut
California nutmeg
canyon live oak
Pacific madrone
mountain alder
mountain dogwood
tanoak
western yew
white alder

Understory forest shrubs include (Hanson, 2003 and 2004):

bald-hip rose
bitter cherry
deerbrush
greenleaf manzanita
mountain misery
mountain pink currant
oceanspray or creambush
pinemat ceanothus
pinemat manzanita
prostrate ceanothus
Sierra chinquapin
Sierra gooseberry
tan oak
True's manzanita
whitethorn ceanothus

Montane chaparral is limited by fire; shrubs include (Hanson, 2003 and 2004):

bitter cherry
creeping snowberry
greenleaf manzanita
huckleberry oak
Sierra chinquapin
wedgeleaf ceanothus

At the lower elevations, herbaceous forest plants include (Hanson, 2003 and 2004):

California puccoon
chaparral honeysuckle
cut-leaf butterweed
dogbane
Eastwood's fritillary
fawn lily
frosted Indian paintbrush
gold back fern
Hartweg's iris
Hartweg's wild ginger
Jepson's onion
lobed violet
maidenhair fern
Mosquin's clarkia
mustang-mint
Pacific bleedinghearts
Pacific hound's tongue
Pacific starflower
redribbons
scarlet fritillary
shining white-stemmed swertia
slender bird's beak
small flowered woodlandstar
sticky bird's beak
sword fern
tall horkelia
wavy-leaved paintbrush
white-stemmed clarkia
woodland strawberry

At the higher elevations, herbaceous forest plants include (Hanson, 2003 and 2004):

bracken fern
closed-lipped penstemon
clustered lady's slipper
creeping snowberry
little prince's pine
Lobb's nama
Mildred's clarkia
pipsisewa
rattlesnake plantain
Sierra laurel
Sierra stickseed
Washington lily
western false Solomon's seal
white-veined wintergreen

Outcrops of metavolcanic, ultramafic, and quartz diorite, lava flows, and andesitic mudflows provide cover and sites for perching, basking, and nesting.

Mountain wildlife habitat supports a variety of resident and migratory animals, which move across and use various adjacent mountain and foothill habitats.

Fishes include:

brown trout
Chinook salmon (spring run)
hardhead
rainbow trout
Sacramento sucker
speckled dace
steelhead

Amphibians and reptiles include:

California mountain kingsnake
common garter snake
gopher snake
mountain yellow-legged frog
western aquatic garter snake
western rattlesnake
western terrestrial garter snake

Birds include:

American dipper
American robin
band-tailed pigeon
blue grouse
brown creeper
calliope hummingbird
Cassin's finch
Cassin's vireo
common raven
dark-eyed junco
dusky flycatcher
evening grosbeak
goshawk
Hammond's flycatcher
hermit warbler
hermit thrush
MacGillivray's warbler
mountain bluebird
mountain chickadee
mountain quail
Nashville warbler
northern pygmy-owl
northern saw-whet owl
olive-sided flycatcher
Pacific-slope flycatcher
red-breasted nuthatch
red crossbill
spotted owl
Steller's jay
Swainson's thrush

varied thrush
western tanager
white-breasted nuthatch
white-headed woodpecker
Wilson's warbler

Mammals include:

black bear
black-tailed deer
California myotis and other bats
chipmunks
coyote
Douglas squirrel
dusky-footed woodrat
fisher
gray fox
long-tailed weasel
marten
mink
mountain lion
northern flying squirrel
Pacific shrew
porcupine
Sierra Nevada red fox
spotted skunk
vagrant shrew

Recreation

The soils of the survey area are rated in tables 15a and 15b according to limitations that affect their suitability for recreation. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect the recreational uses. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with a value of more than 0.00 but less than 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a value of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Ratings of 0.00 are not displayed in the tables.

The ratings in the tables are based on restrictive soil features, such as wetness, slope, and texture of the surface layer. Susceptibility to flooding is considered. Not considered in the ratings, but important in evaluating a site, are the location and accessibility of the area, the size and shape of the area and its scenic quality, vegetation, access to water, potential water impoundment sites, and access to public sewer lines. The capacity of the soil to absorb septic tank effluent and the ability of the soil to support vegetation also are important. Soils that are subject to flooding are limited for recreational uses by the duration and intensity of flooding and the season

when flooding occurs. In planning recreational facilities, onsite assessment of the height, duration, intensity, and frequency of flooding is essential.

The information in tables 15a and 15b can be supplemented by other information in this survey, for example, interpretations for building site development, construction materials, sanitary facilities, and water management.

Table 15a

Camp areas require site preparation, such as shaping and leveling the tent and parking areas, stabilizing roads and intensively used areas, and installing sanitary facilities and utility lines. Camp areas are subject to heavy foot traffic and some vehicular traffic. The ratings are based on the soil properties that affect the ease of developing camp areas and the performance of the areas after development. Slope, stoniness, and depth to bedrock or a cemented pan are the main concerns affecting the development of camp areas. The soil properties that affect the performance of the areas after development are those that influence trafficability and promote the growth of vegetation, especially in heavily used areas. For good trafficability, the surface of camp areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

The management considerations for camp areas are as follows:

Bedrock depth.—Shallow depth to bedrock limits site preparation activities, such as shaping and leveling; may affect plant growth; and restricts the ability of the soil to support multiple-use recreational activities.

Depth to pan.—Depth to a cemented pan limits site preparation activities, such as shaping and leveling; may affect plant growth; and restricts the ability of the soil to support multiple-use recreational activities.

Dusty or very dusty.—Soils that have a silty surface layer and a xeric moisture regime are dusty when dry. Soils derived from volcanic ash also are dusty when dry.

Flooding.—In areas where the soils are subject to flooding, the development and performance of camp areas may be limited. Flooding also affects trafficability.

Fragments (less than 3").—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Development and maintenance of camp areas may be limited, and trafficability may be affected.

Fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance of camp areas may be limited, and trafficability may be affected.

Fragments (greater than 10").—An excessive amount of stones and boulders (rock fragments more than 10 inches in diameter) on the soil surface may impede development and maintenance of camp areas.

Organic surface layer.—Soils in Unified class PT have a high content of organic matter and low strength. Trafficability is affected.

Permeability (Ksat).—The soil horizon with the minimum Ksat governs the rate of water movement through the whole soil. If this rate is low, the transmission of fluids into the soil (infiltration) and through the soil (percolation) is impeded. Water may be ponded for extended periods of time. Trafficability and plant growth are affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede trafficability of heavy machinery and limit the development of camp areas.

Surface clay.—Soils that have a clayey surface layer have a slow rate of water infiltration, are slippery and sticky when wet, and are slow to dry. Trafficability is affected, and compaction may inhibit the growth of common plants.

Surface EC.—Soils with high salinity have a reduced available water capacity and may have salinity toxicity, which restricts vigorous plant growth and hinders the reestablishment of vegetation in disturbed areas.

Surface sand fractions.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Picnic areas are subject to heavy foot traffic. Most vehicular traffic is confined to access roads and parking areas. The ratings are based on the soil properties that affect the ease of developing picnic areas and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of picnic areas. For good trafficability, the surface of picnic areas should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

The management considerations for picnic areas are as follows:

Bedrock depth.—Shallow depth to bedrock limits site preparation activities, such as shaping and leveling; affects plant growth; and restricts the soil's ability to support multiple-use recreational activities.

Depth to pan.—Depth to a cemented pan limits site preparation activities, such as shaping and leveling; affects plant growth; and restricts the soil's ability to support multiple-use recreational activities.

Dusty or very dusty.—Soils that have a silty surface layer and a xeric moisture regime are dusty when dry. Soils derived from volcanic ash also are dusty.

Fragments (less than 3").—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Development and maintenance of picnic areas may be limited, and trafficability may be affected.

Fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance of picnic areas may be limited, and trafficability may be affected.

Fragments (greater than 10").—An excessive amount of stones and boulders (rock fragments more than 10 inches in diameter) on the soil surface may impede development and maintenance of picnic areas.

Frequent flooding.—Flooding limits the use and management of the soils as recreational areas. Trafficability is affected.

Organic surface layer.—Soils in Unified class PT have a high content of organic matter and low strength. Trafficability is affected.

Permeability (Ksat).—The soil horizon with the minimum Ksat governs the rate of water movement through the whole soil. If this rate is low, the transmission of fluids into the soil (infiltration) and through the soil (percolation) is impeded. Water may be ponded for extended periods of time. Trafficability and plant growth are affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede trafficability of heavy machinery and limit the development of picnic areas.

Surface clay.—Soils that have a clayey surface layer have a slow rate of water infiltration, are slippery and sticky when wet, and are slow to dry. Trafficability may be affected, and compaction may hinder the growth of common plants.

Surface EC.—Soils with high salinity have a reduced available water capacity and may have salinity toxicity, which restricts vigorous plant growth and hinders the reestablishment of vegetation in disturbed areas.

Surface sand fractions.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Surface SAR.—In areas where the soils have a high sodium adsorption ratio, plant growth may be restricted. The reestablishment of vegetation is limited in disturbed areas.

Playgrounds require soils that are nearly level, are free of stones, and can withstand intensive foot traffic. The ratings are based on the soil properties that affect the ease of developing playgrounds and that influence trafficability and the growth of vegetation after development. Slope and stoniness are the main concerns affecting the development of playgrounds. For good trafficability, the surface of the playgrounds should absorb rainfall readily, remain firm under heavy foot traffic, and not be dusty when dry. The soil properties that influence trafficability are texture of the surface layer, depth to a water table, ponding, flooding, permeability, and large stones. The soil properties that affect the growth of plants are depth to bedrock or a cemented pan, permeability, and toxic substances in the soil.

The management considerations for playgrounds are as follows:

Bedrock depth.—Shallow depth to bedrock limits site preparation activities, such as shaping and leveling; affects plant growth; and restricts the soil's ability to support multiple-use recreational activities.

Depth to pan.—Depth to a cemented pan limits site preparation activities, such as shaping and leveling; affects plant growth; and restricts the soil's ability to support multiple-use recreational activities.

Dusty or very dusty.—Soils that have a silty surface layer and a xeric moisture regime are dusty when dry. Soils derived from volcanic ash also are dusty.

Fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance of playgrounds may be limited, and trafficability may be affected.

Fragments (greater than 10").—An excessive amount of stones and boulders (rock fragments more than 10 inches in diameter) on the soil surface may impede development and maintenance of playgrounds.

Occasional flooding.—Flooding limits the use and management of the soils as recreational areas. Trafficability is affected.

Organic surface layer.—Soils in Unified class PT have a high content of organic matter and low strength. Trafficability is affected.

Permeability (Ksat).—The soil horizon with the minimum Ksat governs the rate of water movement through the whole soil. If this rate is low, the transmission of fluids into the soil (infiltration) and through the soil (percolation) is impeded. Water may be ponded for extended periods of time. Trafficability and plant growth are affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede site preparation activities, such as shaping and leveling, and restrict the ability of the soil to support multiple-use recreational activities.

Surface clay.—Soils that have a clayey surface layer have a slow rate of water infiltration, are slippery and sticky when wet, and are slow to dry. Trafficability may be affected, and compaction may hinder the growth of common plants.

Surface EC.—Soils with high salinity have a reduced available water capacity and may have salinity toxicity, which restricts vigorous plant growth and hinders the reestablishment of vegetation in disturbed areas.

Surface fragments (less than 3").—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Development and maintenance of playgrounds may be limited, and trafficability may be affected.

Surface sand fractions.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Surface SAR.—In areas where the soils have a high sodium adsorption ratio, plant growth may be restricted. The reestablishment of vegetation is limited in disturbed areas.

Table 15b

Paths and trails for hiking and horseback riding should require little or no slope modification through cutting and filling. The ratings are based on the soil properties that affect trafficability and erodibility. These properties are stoniness, depth to a water table, ponding, flooding, slope, and texture of the surface layer.

The management considerations for paths and trails are as follows:

Dusty or very dusty.—Soils that have a silty surface layer and a xeric moisture regime are dusty when dry. Soils derived from volcanic ash also are dusty.

Fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance of paths and trails may be limited, and trafficability may be affected.

Fragments (greater than 10").—An excessive amount of stones and boulders (rock fragments more than 10 inches in diameter) on the soil surface may impede development and maintenance of paths and trails.

Frequent flooding.—Flooding limits the use and management of the soils as recreational areas. Trafficability is affected.

K factor and slopes.—Soils with a high K factor and steep slopes are susceptible to erosion in areas used for paths and trails. Practices that help to control water erosion may be needed.

Organic surface layer.—Soils in Unified class PT have a high content of organic matter and low strength. Trafficability is affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede site preparation activities, such as shaping and leveling, and restrict the ability of the soil to support multiple-use recreational activities.

Surface clay.—Soils that have a clayey surface layer have a slow rate of water infiltration, are slippery and sticky when wet, and are slow to dry. Trafficability may be affected, and compaction may hinder the growth of common plants.

Surface fragments (less than 3").—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Development and maintenance of paths and trails may be limited, and trafficability may be affected.

Surface sand fractions.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Off-road motorcycle trails require little or no site preparation. They are not covered with surfacing material or vegetation. Considerable compaction of the soil material is likely. The ratings are based on the soil properties that influence erodibility, trafficability, dustiness, and the ease of revegetation. These properties are stoniness, slope, depth to a water table, ponding, flooding, and texture of the surface layer.

The management considerations for off-road motorcycle trails are as follows:

Dusty or very dusty.—Soils that have a silty surface layer and a xeric moisture regime are dusty when dry. Soils derived from volcanic ash also are dusty.

Frequent flooding.—Flooding limits the use and management of the soils as recreational areas. Trafficability is affected.

Organic surface layer.—Soils in Unified class PT have a high content of organic matter and low strength. Trafficability is affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede site preparation activities, such as shaping and leveling, and restrict the ability of the soil to support multiple-use recreational activities.

Surface clay.—Soils that have a clayey surface layer have a slow rate of water infiltration, are slippery and sticky when wet, and are slow to dry. Trafficability may be affected, and compaction may hinder the growth of common plants.

Surface fragments (less than 3").—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Development and maintenance of off-road motorcycle trails may be limited, and trafficability may be affected.

Surface fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance of off-road motorcycle trails may be limited, and trafficability may be affected.

Surface fragments (greater than 10").—An excessive amount of stones and boulders (rock fragments more than 10 inches in diameter) on the soil surface may impede development and maintenance of off-road motorcycle trails.

Surface sand fractions.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Areas used for *lawns, landscaping, and golf fairways* require soils on which turf and ornamental trees and shrubs can be established and maintained. Such areas are subject to heavy foot traffic and some light vehicular traffic. Cutting or filling may be required. Irrigation is not considered in the ratings. The ratings are based on the soil properties that affect plant growth and trafficability after vegetation is established. The properties that affect plant growth are reaction; depth to a water table; ponding; depth to bedrock or a cemented pan; the available water capacity in the upper 40 inches; the content of salts, sodium, or calcium carbonate; and sulfidic materials. The properties that affect trafficability are flooding, depth to a water table, ponding, slope, stoniness, and the amount of sand, clay, or organic matter in the surface layer. The suitability of the soil for traps, tees, roughs, and greens is not considered in the ratings.

The management considerations for lawns, landscaping, and golf fairways are as follows:

AWC.—Soils with a low available water capacity are droughty. This condition restricts plant growth and the establishment of grasses, shrubs, and trees.

Bedrock depth.—Shallow depth to bedrock limits the volume of soil that can be occupied by plant roots and may restrict plant growth.

Clay in surface.—Soils that have a clayey surface layer have a slow rate of water infiltration and are subject to compaction. The growth of grass and ornamental plantings may be limited. Trafficability may also be affected.

Depth to pan.—Shallow soils have a reduced water-holding capacity and restricted percolation rates. Plant growth may be affected.

Flooding.—In areas that are subject to more than rare flooding, trafficability may be affected.

Fragments (greater than 3").—An excessive amount of rock fragments more than 3 inches in diameter in the surface layer is a concern. Development and maintenance may be limited, and trafficability may be affected.

Fragments (gravel size).—Gravel (rock fragments less than 3 inches in diameter) in the surface layer is a concern. Maintenance and trafficability may be affected.

Loamy coarse sand surface.—Soils that have a sandy surface layer are subject to blowing sand, are difficult to revegetate, are soft and loose, and are droughty. Trafficability is affected, and the ability of the soil to support multiple-use recreational activities is limited.

Organic surface layer.—Soils in which the surface layer has a high content of organic matter have low strength. Trafficability is affected.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Soils that are subject to ponding have restrictions that limit the installation and functioning of most land use applications. Trafficability may be affected.

Saturation.—In areas of soils that have a water table at a shallow depth, plant growth and trafficability may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes impede the use of heavy machinery.

Surface EC.—Soils with high salinity have a reduced available water capacity and may have salinity toxicity, which restricts vigorous plant growth.

Engineering

This section provides information for planning land uses related to urban development and to water management. Soils are rated for various uses, and the most limiting features are identified. Ratings are given for building site development, sanitary facilities, construction materials, and water management. The ratings are based on observed performance of the soils and on the data in the tables described under the heading “Soil Properties.”

Information in this section is intended for land use planning, for evaluating land use alternatives, and for planning site investigations prior to design and construction. The information, however, has limitations. For example, estimates and other data generally apply only to that part of the soil between the surface and a depth of 5 to 7 feet. Because of the map scale, small areas of different soils may be included within the mapped areas of a specific soil.

The information is not site specific and does not eliminate the need for onsite investigation of the soils or for testing and analysis by personnel experienced in the design and construction of engineering works.

Government ordinances and regulations that restrict certain land uses or impose specific design criteria were not considered in preparing the information in this section.

Local ordinances and regulations should be considered in planning, in site selection, and in design.

Soil properties, site features, and observed performance were considered in determining the ratings in this section. During the fieldwork for this soil survey, determinations were made about particle-size distribution, liquid limit, plasticity index, soil reaction, depth to bedrock, hardness of bedrock within 5 to 7 feet of the surface, soil wetness, depth to a water table, ponding, slope, likelihood of flooding, natural soil structure aggregation, and soil density. Data were collected about kinds of clay minerals, mineralogy of the sand and silt fractions, and the kinds of adsorbed cations. Estimates were made for erodibility, permeability, corrosivity, shrink-swell potential, available water capacity, and other behavioral characteristics affecting engineering uses.

This information can be used to evaluate the potential of areas for residential, commercial, industrial, and recreational uses; make preliminary estimates of construction conditions; evaluate alternative routes for roads, streets, highways, pipelines, and underground cables; evaluate alternative sites for sanitary landfills, septic tank absorption fields, and sewage lagoons; plan detailed onsite investigations of soils and geology; locate potential sources of gravel, sand, reclamation material, roadfill, and topsoil; plan structures for water management; and predict performance of proposed small structures and pavements by comparing the performance of existing similar structures on the same or similar soils.

The information in the tables, along with the soil maps, the soil descriptions, and other data provided in this survey, can be used to make additional interpretations.

Some of the terms used in this soil survey have a special meaning in soil science and are defined in the Glossary.

Building Site Development

Soil properties influence the development of building sites, including the selection of the site, the design of the structure, construction, performance after construction, and maintenance. Tables 16a and 16b show the degree and kind of soil limitations that affect dwellings with and without basements, small commercial buildings, local roads and streets, and shallow excavations.

The ratings in the tables are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect building site development. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with a value of more than 0.00 but less than 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a value of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Ratings of 0.00 are not displayed in the tables.

Table 16a

Dwellings are single-family houses of three stories or less. For dwellings without basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost

penetration, whichever is deeper. For dwellings with basements, the foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of about 7 feet. The ratings for dwellings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table (saturation), ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility. Compressibility is inferred from the Unified classification. The properties that affect the ease and amount of excavation include depth to a water table (saturation), ponding, flooding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

The management considerations for dwellings without basements are as follows:

Bedrock (hard).—Shallow depth to hard bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Bedrock (soft).—Shallow depth to soft bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Flooding.—In areas that are subject to flooding, the construction and functioning of buildings is limited.

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery.

Organic matter.—Soils in Unified class PT, OL, or OH have a high content of organic matter and low strength and are hard to compact.

Pan (thick).—Depth to a thick cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding restricts the installation and functioning of most land use applications.

Saturation.—In areas of soils that have a water table at a shallow depth, the ability of the soil to support a load may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Shrink-swell (LEP).—Excessive shrinking and swelling in the thickest layer between depths of 25 and 100 centimeters can result in shifting of building foundations, cracking of flooring slabs, and buckling of roadways.

Slope.—Steep slopes impede the use of heavy machinery and affect the ease and amount of excavation.

Thin pan.—Depth to a thin cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

The management considerations for dwellings with basements are as follows:

Bedrock (hard).—Shallow depth to hard bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Bedrock (soft).—Shallow depth to soft bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery.

Frequent or occasional flooding.—In areas that are subject to flooding, the construction and functioning of buildings is limited.

Organic matter.—Soils in Unified class PT, OL, or OH have a high content of organic matter and low strength and are hard to compact.

Pan (thick).—Depth to a thick cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Pan (thin).—Depth to a thin cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Ponding.—Ponding is the condition where standing water is on the soil surface for

any period of time. Ponding restricts the installation and functioning of most land use applications.

Saturation.—In areas of soils that have a water table at a shallow depth, the ability of the soil to support a load may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Shrink-swell (LEP).—Excessive shrinking and swelling in the thickest layer between depths of 25 and 150 centimeters can result in shifting of building foundations and cracking of basements.

Slope.—Steep slopes impede the use of heavy machinery and affect the ease and amount of excavation.

Small commercial buildings are structures that are less than three stories high and do not have basements. The foundation is assumed to consist of spread footings of reinforced concrete built on undisturbed soil at a depth of 2 feet or at the depth of maximum frost penetration, whichever is deeper. The ratings are based on the soil properties that affect the capacity of the soil to support a load without movement and on the properties that affect excavation and construction costs. The properties that affect the load-supporting capacity include depth to a water table (saturation), ponding, flooding, subsidence, linear extensibility (shrink-swell potential), and compressibility (which is inferred from the Unified classification). The properties that affect the ease and amount of excavation include flooding, depth to a water table (saturation), ponding, slope, depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, and the amount and size of rock fragments.

The management considerations for small commercial buildings are as follows:

Bedrock (hard).—Shallow depth to hard bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Bedrock (soft).—Shallow depth to soft bedrock limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Flooding.—In areas that are subject to flooding, the construction and functioning of buildings is limited. Flooding also affects the amount and ease of excavation

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery.

Organic matter.—Soils in Unified class PT, OL, or OH have a high content of organic matter and low strength and are hard to compact.

Pan (thick).—Depth to a thick cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding restricts the installation and functioning of most land use applications.

Saturation.—In areas of soils that have a water table at a shallow depth, the ability of the soil to support a load may be affected. Such areas are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Shrink-swell (LEP).—Excessive shrinking and swelling in the thickest layer between depths of 25 and 100 centimeters can result in shifting of building foundations, cracking of flooring slabs, and buckling of roadways.

Slope.—Steep slopes impede the use of heavy machinery and affect the ease and amount of excavation.

Thin pan.—Depth to a thin cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Table 16b

Local roads and streets have an all-weather surface and carry automobile and light truck traffic all year. They have a subgrade of cut or fill soil material; a base of gravel, crushed rock, or soil material stabilized by lime or cement; and a surface of flexible material (asphalt), rigid material (concrete), or gravel with a binder. The ratings are

based on the soil properties that affect the ease of excavation and grading and the traffic-supporting capacity. The properties that affect the ease of excavation and grading are depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, depth to a water table (saturation), ponding, flooding, the amount of large stones, and slope. The properties that affect the traffic-supporting capacity are soil strength (as inferred from the AASHTO group index number), subsidence, linear extensibility (shrink-swell potential), the potential for frost action, depth to a water table (saturation), and ponding.

The management considerations for local roads and streets are as follows:

AASHTO GI (soil strength).—Soils with a high AASHTO group index number (GIN) have low strength, which affects the traffic-supporting capacity of the soil. This condition is only partially restrictive if the clay mineralogy is kaolinitic.

Bedrock (hard).—Shallow depth to hard bedrock limits site preparation activities, such as shaping and leveling, and affects the ease of excavation and grading for the construction of roads and streets.

Bedrock (soft).—Shallow depth to soft bedrock limits site preparation activities, such as shaping and leveling, and affects the ease of excavation and grading for the construction of roads and streets.

Flooding.—Flooding can damage roads and streets.

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery.

Pan (thick).—Depth to a thick cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Saturation.—In areas of soils that have a water table at a shallow depth, the ability of the soil to support a load may be affected. The ease of excavation and grading may also be affected. Such areas can become waterlogged and boggy during periods of heavy precipitation and are slow to drain.

Shrink-swell (LEP).—Excessive shrinking and swelling in the thickest layer between depths of 25 and 100 centimeters can result in the buckling of roadways.

Slope.—Steep slopes impede the use of heavy machinery and affect the ease of excavation and grading.

Thin pan.—Depth to a thin cemented pan limits site preparation activities, such as shaping and leveling, and affects the ease and depth of excavation.

Shallow excavations are trenches or holes dug to a maximum depth of 5 or 6 feet for graves, utility lines, open ditches, or other purposes. The ratings are based on the soil properties that influence the ease of digging and the potential for the caving of cutbanks. Depth to bedrock or a cemented pan, hardness of bedrock or a cemented pan, the amount of large stones, and dense layers influence the ease of digging, filling, and compacting. Depth to the seasonal high water table (saturation), flooding, and ponding may restrict the period when excavations can be made. Slope influences the ease of using machinery. Soil texture, depth to the water table, and linear extensibility (shrink-swell potential) influence the potential for the caving of cutbanks.

The management considerations for shallow excavations are as follows:

Caving potential.—Because of the texture of the soil, the potential for the caving of cutbanks is high. Extreme caution should be exercised around cutbanks to prevent injury resulting from cave-ins.

Bedrock (hard).—Shallow depth to hard bedrock limits site preparation and affects the ease of digging, filling, and compacting.

Bedrock (soft).—Shallow depth to soft bedrock limits site preparation and affects the ease of digging, filling, and compacting.

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil; affect the ease of digging, filling, and compacting; and restrict the use of heavy machinery.

Frequent or occasional flooding.—Flooding may restrict the periods when excavations can be made.

Organic matter (PT, OH, OL) below 20".—Soils in Unified class PT, OH, or OL have a high content of organic matter and low strength, which may influence the potential for the caving of cutbanks.

Pan (thick).—Depth to a thick cemented pan affects the ease of digging, filling, and compacting.

Pan (thin).—Depth to a thin cemented pan affects the ease of digging, filling, and compacting.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding restricts the installation and functioning of most land use applications and may limit the period when excavations can be made.

Saturation.—In areas of soils that have a water table at a shallow depth, the period when excavations can be made may be restricted. Such areas can become waterlogged and boggy during periods of heavy precipitation and are slow to drain.

Slope.—Steep slopes restrict the use of heavy machinery.

Sanitary Facilities

Tables 17a and 17b show the degree and kind of soil limitations that affect septic tank absorption fields, sewage lagoons, sanitary landfills, and daily cover for landfill. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with a value of more than 0.00 but less than 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a value of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00). Ratings of 0.00 are not displayed in the tables.

Table 17a

Septic tank absorption fields are areas in which effluent from a septic tank is distributed into the soil through subsurface tiles or perforated pipe. Only that part of the soil between depths of 24 and 60 inches is evaluated. The ratings are based on the soil properties that affect absorption of the effluent, construction and maintenance of the system, and public health. Permeability (Ksat), depth to a water table (saturation), ponding, depth to bedrock or a cemented pan, and flooding affect absorption of the effluent. Stones and boulders, ice, and bedrock or a cemented pan interfere with installation. Subsidence interferes with installation and maintenance. Excessive slope may cause lateral seepage and surfacing of the effluent in downslope areas.

Some soils are underlain by loose sand and gravel or fractured bedrock at a depth of less than 4 feet below the distribution lines. In these soils the absorption field may not adequately filter the effluent, particularly when the system is new. As a result, the ground water may become contaminated.

The management considerations for septic tank absorption fields are as follows:

Depth to bedrock.—The depth to bedrock affects the construction, installation, and functioning of septic tank absorption fields and affects other site applications. Shallow

soils have a limited absorption capacity and have biologically active zones through which waste materials can percolate. If these soils are used as filter fields, environmental and health risks should be considered.

Depth to pan.—Depth to a cemented pan affects the construction, installation, and functioning of septic tank adsorption fields and other site applications. Shallow soils have a limited absorption capacity and have biologically active zones through which waste materials can percolate. If these soils are used as filter fields, environmental and health risks should be considered.

Flooding, rare flooding, or very rare flooding.—Flooding can transport waste offsite and pollute surface waters. Flooding limits the use and management of the soil for sanitary facilities.

Fragments (greater than 3").—Rock fragments larger than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery during construction of absorption fields.

Permeability greater than 6"/hr.—The soil horizon with the maximum Ksat governs the leaching and seepage potential of the soil. If this rate is high, the transmission of fluids through the soil is unimpeded and leaching and seepage may affect environmental, health, and performance considerations.

Permeability less than 0.6"/hr; permeability from 0.6 to 2"/hr.—The soil horizon with the minimum Ksat governs the rate of water movement through the whole soil. If this rate is low, the transmission of fluids into and through the soil is impeded and runoff, infiltration, and percolation of pollutants may affect environmental, health, and performance considerations.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the installation and functioning of most land use applications.

Saturation.—Soils that have a water table at a shallow depth may become waterlogged during periods of heavy precipitation and are slow to drain. The contamination of ground water is a concern in areas of these soils.

Seepage in bottom layer.—The Ksat in the bottom layer of the soil governs the leaching and seepage potential of the soil. If this rate is high, the transmission of fluids through the soil and underlying materials is unimpeded. As a result, leaching and seepage may affect environmental, health, and performance considerations.

Slope.—Steep slopes affect the transmission of fluids through the soil. As a result, piping or seepage may affect environmental, health, and performance considerations.

Sewage lagoons are shallow ponds constructed to hold sewage while aerobic bacteria decompose the solid and liquid wastes. Lagoons should have a nearly level floor surrounded by cut slopes or embankments of compacted soil. Nearly impervious soil material for the lagoon floor and sides is required to minimize seepage and contamination of ground water. Considered in the ratings are slope, permeability, depth to a water table, ponding, depth to bedrock or a cemented pan, flooding, rock fragments larger than 3 inches in diameter, and content of organic matter.

Soil permeability (Ksat) is a critical property affecting the suitability for sewage lagoons. Most porous soils eventually become sealed when they are used as sites for sewage lagoons. Until sealing occurs, however, the hazard of pollution is severe. Soils that have a permeability rate of more than 2 inches per hour are too porous for the proper functioning of sewage lagoons. In these soils, seepage of the effluent can result in contamination of the ground water. Ground-water contamination is also a hazard if fractured bedrock is within a depth of 40 inches, if the water table is high enough to raise the level of sewage in the lagoon, or if floodwater overtops the lagoon.

A high content of organic matter is detrimental to proper functioning of the lagoon because it inhibits aerobic activity. Slope, bedrock, and cemented pans can cause construction problems, and large stones can hinder compaction of the lagoon floor. If the lagoon is to be uniformly deep throughout, the slope must be gentle enough and

the soil material must be thick enough over bedrock or a cemented pan to make land smoothing practical.

The management considerations for sewage lagoons are as follows:

Bedrock (hard).—Shallow depth to hard bedrock affects the construction, installation, and functioning of sewage lagoons.

Bedrock (soft).—Shallow depth to soft bedrock affects the construction, installation, and functioning of sewage lagoons.

Depth to pan.—Depth to a cemented pan affects the construction, installation, and functioning of sewage lagoons.

Flooding.—Flooding can transport waste offsite and pollute surface waters. Flooding limits the use and management of the soil for sanitary facilities.

Fragments (greater than 3").—Rock fragments larger than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery.

Permeability greater than 2"/hr; permeability 0.6 to 2"/hr.—The soil horizon with the maximum Ksat governs the leaching and seepage potential of the soil. If this rate is high, the transmission of fluids through the soil is unimpeded and leaching and seepage may affect environmental, health, and performance considerations.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the installation and functioning of most land use applications.

Saturation.—Soils that have a water table at a shallow depth may become waterlogged during periods of heavy precipitation and are slow to drain. The contamination of ground water is a concern in areas of these soils.

Slope.—Steep slopes impede site preparation and construction and restrict the size and shape of the lagoon.

Table 17b

A *trench sanitary landfill* is an area where solid waste is placed in successive layers in an excavated trench. The waste is spread, compacted, and covered daily with a thin layer of soil excavated at the site. When the trench is full, a final cover of soil material at least 2 feet thick is placed over the landfill. The ratings in the table are based on the soil properties that affect the risk of pollution, the ease of excavation, trafficability, and revegetation. These properties include permeability, depth to bedrock or a cemented pan, depth to a water table, ponding, slope, flooding, texture, stones and cobbles, highly organic layers, soil reaction, and content of salts and sodium. Unless otherwise stated, the ratings apply only to that part of the soil within a depth of about 6 feet. For deeper trenches, onsite investigation may be needed.

Hard, nonrippable bedrock, fractured bedrock, or highly permeable strata in or directly below the proposed trench bottom can affect the ease of excavation and the hazard of ground-water pollution. Slope affects construction of the trenches and the movement of surface water around the landfill. It also affects the construction and performance of roads in areas of the landfill.

Soil texture and consistence affect the ease with which the trench is dug and the ease with which the soil can be used as daily or final cover. They determine the workability of the soil when dry and when wet. Soils that are plastic and sticky when wet are difficult to excavate, grade, or compact and are difficult to place as a uniformly thick cover over a layer of refuse.

The soil material used as the final cover for a trench landfill should be suitable for plants. It should not have excess sodium or salts and should not be too acid. The surface layer generally has the best workability, the highest content of organic matter, and the best potential for plants. Material from the surface layer should be stockpiled for use as the final cover.

The management considerations for trench sanitary landfills are as follows:

Clay or silty clay; clay loam, silty clay, silty clay loam.—Clayey soils may become sticky when wet and are difficult to spread and compact. This condition is only partially restrictive if the clay mineralogy is kaolinitic.

Depth to thin cemented pan.—Depth to a cemented pan may limit the construction of the landfill and can affect environmental and health considerations.

Flooding.—Flooding can transport agricultural waste offsite and pollute surface waters. Flooding limits the use and management of the soil for sanitary facilities.

Fragments (3-10").—Cobbles (rock fragments 3 to 10 inches in diameter) impede the workability of the soil and restrict the use of heavy machinery. They also affect site reclamation.

Lithic or paralithic bedrock.—Shallow soils have a limited absorption capacity and have biologically active zones through which waste materials can percolate. If these soils are used as sites for trench sanitary landfills, environmental and health risks should be considered.

Organic matter.—Soils in Unified class PT, OH, or OL have a high content of organic matter and low strength, which may affect the use of heavy machinery.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the installation and functioning of most land use applications.

Sandy textures.—Sandy soils are subject to caving and are droughty. The establishment of vegetative cover is difficult in areas of these soils.

Saturation.—Soils that have a water table at a shallow depth may become waterlogged during periods of heavy precipitation and are slow to drain. The contamination of ground water is a concern in areas of these soils.

Seepage in bottom layer.—The Ksat in the bottom layer of the soil governs the leaching and seepage potential of the soil. If this rate is high, the transmission of fluids through the soil and underlying materials is unimpeded. As a result, leaching and seepage may affect environmental, health, and performance considerations.

Slope.—Steep slopes affect the transmission of fluids through the soil. As a result, piping or seepage may affect environmental, health, and performance considerations.

In an *area sanitary landfill*, solid waste is placed in successive layers on the surface of the soil. The waste is spread, compacted, and covered daily with a thin layer of soil from a source away from the site. A final cover of soil material at least 2 feet thick is placed over the completed landfill. The ratings in the table are based on the soil properties that affect trafficability and the risk of pollution. These properties include flooding, permeability (Ksat), depth to a water table (saturation), ponding, slope, and depth to bedrock or a cemented pan.

Flooding is a serious problem because it can result in pollution in areas downstream from the landfill. If permeability is too rapid or if fractured bedrock, a fractured cemented pan, or the water table is close to the surface, the leachate can contaminate the water supply. Slope is a consideration because of the extra grading required to maintain roads in the steeper areas of the landfill. Also, leachate may flow along the surface of the soils in the steeper areas and cause difficult seepage problems.

The management considerations for area sanitary landfills are as follows:

Bedrock depth.—Shallow depth to bedrock may restrict the construction and installation of the landfill and can result in environmental and health risks.

Depth to pan.—Depth to a cemented pan may restrict the construction and installation of the landfill and can result in environmental and health risks.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the installation and functioning of most land use applications.

Saturation.—Soils that have a water table at a shallow depth may become waterlogged during periods of heavy precipitation and are slow to drain. The contamination of ground water is a concern in areas of these soils.

Seepage.—The soil horizon with the maximum Ksat governs the leaching and seepage potential of the soil. If this rate is high, the transmission of fluids into and through the soil is unimpeded. As a result, leaching and seepage may affect environmental, health, and performance considerations.

Slope.—Steep slopes impede the use of heavy machinery and can limit the reclamation of borrow sites.

Very rare flooding, rare flooding, occasional flooding, frequent flooding.—Flooding can transport waste offsite and pollute surface waters. Flooding limits the use and management of the soil for sanitary facilities.

Daily cover for landfill is the soil material that is used to cover compacted solid waste in an area sanitary landfill. The soil material is obtained offsite, transported to the landfill, and spread over the waste. The ratings in the table also apply to the final cover for a landfill. They are based on the soil properties that affect workability, the ease of digging, and the ease of moving and spreading the material over the refuse daily during wet and dry periods. These properties include soil texture, depth to a water table, ponding, rock fragments, slope, depth to bedrock or a cemented pan, reaction, and content of salts, sodium, or lime.

Loamy or silty soils that are free of large stones and excess gravel are the best cover for a landfill. Clayey soils may be sticky and difficult to spread; sandy soils are subject to wind erosion.

Slope affects the ease of excavation and of moving the cover material. Also, it can influence runoff, erosion, and reclamation of the borrow area.

After soil material has been removed, the soil material remaining in the borrow area must be thick enough over bedrock, a cemented pan, or the water table to permit revegetation. The soil material used as the final cover for a landfill should be suitable for plants. It should not have excess sodium, salts, or lime and should not be too acid.

The management considerations affecting daily cover for landfill are as follows:

Depth to bedrock.—The depth to bedrock limits the volume of material suitable for use as landfill cover. Reclamation and revegetation also are difficult in areas of shallow soils.

Depth to pan.—Depth to a cemented pan limits the volume of material suitable for use as landfill cover. Reclamation and revegetation also are difficult in areas of shallow soils.

Fragments (greater than 3").—Rock fragments larger than 3 inches in diameter impede the workability of the soil and restrict the use of heavy machinery. They also affect site reclamation.

Fragments (less than 75 mm).—A high content of gravel (rock fragments less than 75 mm in diameter) may impede the workability of the soil and restrict the use of heavy machinery. It can also affect site reclamation.

Organic matter.—Soils in Unified class PT have a high content of organic matter and low strength and are hard to reclaim.

Packing.—Soils in Unified classes MH, OL, OH, or CH are hard to pack. This condition is only partially restrictive if the clay mineralogy is kaolinitic.

Permeability (Ksat).—A high Ksat results in unimpeded water movement through the soil. As a result, seepage and/or leaching may be a concern.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the installation and functioning of most land use applications.

Sandy textures.—Sandy soils may be subject to soil blowing and are droughty. The establishment of vegetative cover is difficult in areas of these soils.

Saturation.—Shallow depth to a water table limits the volume of material suitable for use as landfill cover. Reclamation and revegetation also are difficult in areas of shallow soils, and contamination from leaching may be a concern.

Silty clay or clay; silt or clay textures; clay loam, silty clay, silty clay loam.—Soils that have a high content of silt or clay may become sticky when wet and are difficult to spread and compact.

Slope.—Steep slopes impede the use of heavy machinery and can limit the reclamation of borrow sites.

Construction Materials

Tables 18a and 18b give information about the soils as potential sources of gravel, sand, topsoil, reclamation material, and roadfill. Normal compaction, minor processing, and other standard construction practices are assumed.

Table 18a

Gravel and *sand* are natural aggregates suitable for commercial use with a minimum of processing. They are used in many kinds of construction. Specifications for each use vary widely. In table 18a, only the likelihood of finding material in suitable quantity is evaluated. The suitability of the material for specific purposes is not evaluated, nor are factors that affect excavation of the material. The properties used to evaluate the soil as a source of sand or gravel are gradation of grain sizes (as indicated by the Unified classification of the soil), the thickness of suitable material, and the content of rock fragments. If the bottom layer of the soil contains sand or gravel, the soil is considered a likely source regardless of thickness. The assumption is that the sand or gravel layer below the depth of observation exceeds the minimum thickness.

The soils are rated *good, fair,* or *poor* as potential sources of sand and gravel. A rating of *good* or *fair* means that the source material is likely to be in or below the soil. The bottom layer and the thickest layer of the soils are assigned numerical ratings. These ratings indicate the likelihood that the layer is a source of sand or gravel. The numbers 0.00 to 0.07 indicate that the layer is a poor source. The numbers 0.75 to 1.00 indicate that the layer is a good source.

The soils are rated *good, fair,* or *poor* as potential sources of topsoil. The features that limit the soils as sources of this material are specified in the tables. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as a source of topsoil. The lower the number, the greater the limitation.

Topsoil is used to cover an area so that vegetation can be established and maintained. The upper 40 inches of a soil is evaluated for use as topsoil. Also evaluated is the reclamation potential of the borrow area. The ratings are based on the soil properties that affect plant growth; the ease of excavating, loading, and spreading the material; and reclamation of the borrow area. Toxic substances, soil reaction, and the properties that are inferred from soil texture, such as available water capacity and fertility, affect plant growth. The ease of excavating, loading, and spreading is affected by rock fragments, slope, depth to a water table, soil texture, and thickness of suitable material. Reclamation of the borrow area is affected by slope, depth to a water table, rock fragments, depth to bedrock or a cemented pan, and toxic material.

The surface layer of most soils is generally preferred for topsoil because of its organic matter content. Organic matter greatly increases the absorption and retention of moisture and nutrients for plant growth.

Management considerations that affect the potential of the soils as a source of topsoil are as follows:

Clay.—Clayey soils become sticky when wet and have poor tilth. If these soils are used as a source of topsoil, controlling compaction, proper seedbed preparation, and establishing new growth are difficult.

Depth to bedrock.—The depth to bedrock limits the volume of material suitable for use as topsoil or for reclamation.

Depth to pan.—Depth to a cemented pan limits the volume of material suitable for use as topsoil or for reclamation.

EC (electrical conductivity).—In soils with high salinity, plant growth may be restricted and reestablishing vegetation is difficult.

Hard to reclaim.—Because of shallow depth to layers with high bulk density, revegetation and reclamation are difficult. These layers have a low available water capacity and restricted percolation rates. Also, soils that have rock fragments are hard to reclaim. The rock fragments interfere with grading, seeding, germination, and plant growth.

OM.—Soils that have a high content of organic matter have low strength and are difficult to reclaim.

pH.—In soils that have low pH, plant growth is restricted and reestablishing vegetation is difficult.

Rock fragment content.—Rock fragments in the soil interfere with grading, seeding, germination, and plant growth.

Sand fractions.—In soils that have a thick sandy layer with a low content of clay, revegetation is difficult. Also, wind erosion is a hazard in areas of these soils.

SAR.—In soils with a high sodium adsorption ratio, plant growth is restricted and reestablishing vegetation is difficult.

Saturation; no saturated zone.—Shallow depth to a water table can limit the volume of material suitable for use as topsoil. Reclamation and revegetation may be difficult. The soils are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes restrict the use of heavy machinery and affect the reclamation of borrow sites.

Table 18b

The soils are rated *good, fair,* or *poor* as potential sources of reclamation material and roadfill. The features that limit the soils as sources of these materials are specified in the tables. The numerical ratings given after the specified features indicate the degree to which the features limit the soils as sources of reclamation material or roadfill. The lower the number, the greater the limitation.

Reclamation material is used in areas that have been drastically disturbed by surface mining or similar activities. When these areas are reclaimed, layers of soil material or unconsolidated geological material, or both, are replaced in a vertical sequence. The reconstructed soil favors plant growth. The ratings in the table do not apply to quarries and other mined areas that require an offsite source of reconstruction material. The ratings are based on the soil properties that affect erosion and stability of the surface and the productive potential of the reconstructed soil. These properties include the content of sodium, salts, and calcium carbonate; reaction; available water capacity; erodibility; texture; content of rock fragments; and content of organic matter and other features that affect fertility.

Management considerations that affect the potential of the soils as a source of reclamation material are as follows:

AWC.—The available water capacity affects plant growth and the establishment of grasses, shrubs, and trees.

Calcium carbonates.—A high content of calcium carbonate may limit the growth of some plant species.

Clay.—Clayey soils may become sticky when wet and are difficult to spread and compact.

Depth to pan.—Depth to a cemented pan limits the volume of material suitable for reclamation.

Fragments 3-10".—An excessive content of cobbles (rock fragments 3 to 10 inches in diameter) in the upper 72 inches (180 cm) of the soil can interfere with the use of construction equipment.

Fragments greater than 10".—An excessive content of stones or boulders (rock fragments more than 10 inches in diameter) in the upper 72 inches (180 cm) of the soil can interfere with the use of construction equipment.

K factor.—Soils that have a high K factor are subject to water erosion if they are used as a source of reclamation material. Measures that help to control water erosion are needed.

Maximum pH greater than 8.5.—In soils with high pH, plant growth is restricted and reestablishing vegetation is difficult.

OM.—Soils that have a low content of organic matter have poor tilth and inherent fertility problems. Additions of organic material may be needed.

pH is between 4 and 6.5 above 40".—In soils that have low pH, plant growth is restricted and reestablishing vegetation is difficult.

Sand fractions.—In soils that have a thick sandy layer with a low content of clay, revegetation is difficult. Also, wind erosion is a hazard in areas of these soils.

SAR.—In soils with a high sodium adsorption ratio, plant growth is restricted and reestablishing vegetation is difficult in disturbed areas.

WEG.—Soils in wind erodibility groups 1 through 3 are susceptible to wind erosion. Measures that help to control wind erosion are needed.

Roadfill is soil material that is excavated in one place and used in road embankments in another place. In this table, the soils are rated as a source of roadfill for low embankments, generally less than 6 feet high and less exacting in design than higher embankments.

The ratings are for the whole soil, from the surface to a depth of about 5 feet. It is assumed that soil layers will be mixed when the soil material is excavated and spread.

The ratings are based on the amount of suitable material and on soil properties that affect the ease of excavation and the performance of the material after it is in place. The thickness of the suitable material is a major consideration. The ease of excavation is affected by large stones, depth to a water table, and slope. How well the soil performs in place after it has been compacted and drained is determined by its strength (as inferred from the AASHTO classification of the soil) and linear extensibility (shrink-swell potential).

Management considerations that affect the potential of the soils as a source of roadfill are as follows:

AASHTO GIN.—Soils with a high AASHTO group index number have low strength, which affects the traffic-supporting capacity of the soil and reduces the potential of the soil as a source of roadfill. This condition is only partially restrictive if the clay mineralogy is kaolinitic.

Depth to bedrock.—The depth to bedrock limits the volume of material suitable for use as roadfill.

Depth to pan.—Depth to a cemented pan limits the volume of material suitable for use as roadfill.

Fragments greater than 3".—Rock fragments more than 3 inches in diameter can interfere with the use of construction equipment and can hinder grade stabilization.

LEP (shrink-swell).—Excessive shrinking and swelling can result in the shifting of roads and the cracking of pavement.

Saturation; no saturated zone.—Shallow depth to a water table can limit the volume of material suitable for use as roadfill. Reclamation and revegetation may be difficult. The soils are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Slope.—Steep slopes restrict the use of heavy machinery and affect the reclamation of borrow sites.

Water Management

Table 19a, 19b, and 19c provide information on the soil properties and site features that affect water management. The degree and kind of soil limitations are given for pond reservoir areas; embankments, dikes, and levees; and five irrigation design systems. The ratings are both verbal and numerical. Rating class terms indicate the extent to which the soils are limited by all of the soil features that affect these uses. *No limitations* indicates that the soil has features that are very favorable for the specified use. Good performance and very low maintenance can be expected. *Limitations* with values between 0.00 and 1.00 can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected. *Limitations* with a value of 1.00 indicate that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

Numerical ratings in the tables indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

Table 19a

Pond reservoir areas hold water behind a dam or embankment. Soils best suited to this use have low seepage potential in the upper 60 inches. The seepage potential is determined by the permeability of the soil and the depth to fractured bedrock or other permeable material. Excessive slope can affect the storage capacity of the reservoir area.

Management considerations affecting pond reservoir areas are as follows.

Depth to bedrock.—Shallow depth to bedrock limits site preparation, the depth of the reservoir, and pond maintenance.

Depth to pan.—Shallow depth to a cemented pan limits site preparation, the depth of the reservoir, and pond maintenance.

Permeability (Ksat).—The soil horizon with the maximum Ksat governs the seepage potential of the soil. If this rate is high, the transmission of fluids into and through the soil is unimpeded and seepage may be a concern.

Slope.—Steep slopes impede site preparation and construction and restrict the size and shape of the reservoir.

Embankments, dikes, and levees are raised structures of soil material, generally less than 20 feet high, constructed to impound water or to protect land against overflow. Embankments that have zoned construction (core and shell) are not considered. In this table, the soils are rated as a source of material for embankment fill. The ratings apply to the soil material below the surface layer to a depth of about 5 feet. It is assumed that soil layers will be uniformly mixed and compacted during construction.

The ratings do not indicate the ability of the natural soil to support an embankment. Soil properties to a depth even greater than the height of the embankment can affect performance and safety of the embankment. Generally, deeper onsite investigation is needed to determine these properties.

Soil material in embankments must be resistant to seepage, piping, and erosion and have favorable compaction characteristics. Unfavorable features include less than 5 feet of suitable material and a high content of stones or boulders, organic matter, or salts or sodium. A high water table affects the amount of usable material. It also affects trafficability.

Management considerations affecting embankments, dikes, and levees are as follows.

Fragments (greater than 3").—Rock fragments more than 3 inches in diameter impede the workability of the soil, restrict the use of heavy machinery, and affect site reclamation. A high content of rock fragments may also unfavorably affect efforts to compact the soil.

Organic matter.—Soils in Unified class PT, OL, or OH have a high content of organic matter and low strength and are hard to reclaim.

Piping potential.—Fine textured soils that have a high content of sodium and gypsum and low cohesion and liquid limit are subject to piping.

Ponding.—Ponding is the condition where standing water is on the soil surface for any period of time. Ponding limits the timing of installation of embankments, dikes, or levees.

Saturation.—Shallow depth to a water table limits the reclamation and revegetation of the soils. The soils are slow to drain and can become waterlogged and boggy during periods of heavy precipitation.

Seepage.—Soils that have gravel or sand in the bottom layer or thickest layer are subject to seepage.

Shrink-swell; MH or CH Unified.—Fine textured soils with a high plasticity index and liquid limit are difficult to compact. Soils that have a high shrink-swell potential tend to crack as they dry.

Thin layer.—Shallow depth to a cemented restrictive layer limits the amount of source material available for constructing dikes, levees, or water-retention embankments.

Table 19b

Basin or paddy irrigation systems are generally used for paddy irrigation for rice. They require considerable land preparation. Soil properties affecting the performance of these systems are similar to those listed for graded border systems. Where rice is grown, however, slow water movement, ponding, and clayey textures are not limitations.

Graded border irrigation systems are methods of surface irrigation best adapted to grain and forage crops. Borders are divided by levees running down the slope at uniform spacings. Soil properties affecting the performance of graded border irrigations systems include sandy textures, slope, rock fragments on the surface, slow water movement, and a shallow depth to a cemented pan or bedrock.

Table 19c

Sprinkler irrigation systems vary in shape, size, and design, depending on crop needs and soil type. These systems can perform over a wider range of soils than border irrigation systems. Most systems can perform on slopes up to about 15 percent. Ponding, erodibility of the surface layer, and depth to a cemented pan or bedrock are typical factors affecting design and performance of the system.

Drip or trickle irrigation systems are very efficient and are most economical for widely spaced crops, such as trees and vines. Slope is generally not a limitation, and the movement of water through the soil can be controlled by application rates. Soil texture, water movement through the soil, rock fragments on the surface, and available water-holding capacity are less limiting for these systems than for other systems.

Furrow irrigation systems are among the oldest irrigation methods. They require efficient management. A furrow is a small, shallow channel installed down or across the slope of the field. The furrow length should be determined by soil type and slope. Furrows running downslope contribute to soil erosion. Soil texture, erodibility, and depth to a cemented pan or bedrock are typical factors affecting performance and maintenance of the system.

Soil Properties

Data relating to soil properties are collected during the course of the soil survey.

Soil properties are ascertained by field examination of the soils and by laboratory index testing of some benchmark soils. Established standard procedures are followed. During the survey, many shallow borings are made and examined to identify and classify the soils and to delineate them on the soil maps. Samples are taken from some typical profiles and tested in the laboratory to determine particle-size distribution, plasticity, and compaction characteristics.

Estimates of soil properties are based on field examinations, on laboratory tests of samples from the survey area, and on laboratory tests of samples of similar soils in nearby areas. Tests verify field observations, verify properties that cannot be estimated accurately by field observation, and help to characterize key soils.

The estimates of soil properties are shown in tables. They include engineering index properties, physical and chemical properties, and pertinent soil and water features.

Engineering Index Properties

Table 20 gives the engineering classifications and the range of index properties for the layers of each soil in the survey area.

Depth to the upper and lower boundaries of each layer is indicated.

Texture is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. “Loam,” for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, “gravelly.” Textural terms are defined in the Glossary.

Classification of the soils is determined according to the Unified soil classification system (ASTM, 2005) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2004).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group

index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

Rock fragments larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage.

Percentage (of soil particles) passing designated sieves is the percentage of the soil fraction less than 3 inches in diameter based on an ovendry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field.

Liquid limit and *plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination.

The estimates of particle-size distribution, liquid limit, and plasticity index are generally rounded to the nearest 5 percent. Thus, if the ranges of gradation and Atterberg limits extend a marginal amount (1 or 2 percentage points) across classification boundaries, the classification in the marginal zone is generally omitted in the table.

No estimates are made for liquid limit, plasticity index, and Unified and AASHTO classifications for soils with medial or ashy texture modifiers because there is no ASTM procedure for soils with andic soil propeties. The USDA texture is the apparent field texture.

Physical Properties

Tables 21 and 22 show estimates of some physical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area. The estimates are based on field observations and on test data for these and similar soils.

Table 21

Depth to the upper and lower boundaries of each layer is indicated.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In the table, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The amount and kind of clay affect the fertility and physical condition of the soil and the ability of the soil to adsorb cations and to retain moisture. They influence shrink-swell potential, permeability, plasticity, the ease of soil dispersion, and other soil properties. The amount and kind of clay in a soil also affect tillage and earthmoving operations.

Saturated hydraulic conductivity refers to the ability of a soil to transmit water or air. The term “permeability,” as used in soil surveys, indicates saturated hydraulic conductivity (Ksat). The estimates in the table indicate the rate of water movement, in micrometers per second (um/sec), when the soil is saturated. They are based on soil characteristics observed in the field, particularly structure, porosity, and texture. Permeability is considered in the design of soil drainage systems and septic tank absorption fields.

Available water capacity refers to the quantity of water that the soil is capable of storing for use by plants. The capacity for water storage is given in inches of water per inch of soil for each soil layer. The capacity varies, depending on soil properties that affect retention of water. The most important properties are the content of organic

matter, soil texture, bulk density, and soil structure. Available water capacity is an important factor in the choice of plants or crops to be grown and in the design and management of irrigation systems. Available water capacity is not an estimate of the quantity of water actually available to plants at any given time.

Linear extensibility refers to the change in length of an unconfined clod as moisture content is decreased from a moist to a dry state. It is an expression of the volume change between the water content of the clod at 1/3- or 1/10-bar tension (33kPa or 10kPa tension) and oven dryness. The volume change is reported in the table as percent change for the whole soil. Volume change is influenced by the amount and type of clay minerals in the soil.

Linear extensibility is used to determine the shrink-swell potential of soils. The shrink-swell potential is low if the soil has a linear extensibility of less than 3 percent; moderate if 3 to 6 percent; high if 6 to 9 percent; and very high if more than 9 percent. If the linear extensibility is more than 3, shrinking and swelling can cause damage to buildings, roads, and other structures and to plant roots. Special design commonly is needed.

Organic matter is the plant and animal residue in the soil at various stages of decomposition. In the table, the estimated content of organic matter is expressed as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

The content of organic matter in a soil can be maintained by returning crop residue to the soil. Organic matter has a positive effect on available water capacity, water infiltration, soil organism activity, and tilth. It is a source of nitrogen and other nutrients for crops and soil organisms.

Table 22

Depth to the upper and lower boundaries of each layer is indicated.

Erosion factors are shown in table 22 as the K factor (K and Kf) and the T factor. Erosion factor K indicates the susceptibility of a soil to sheet and rill erosion by water. Factor K is one of six factors used in the Universal Soil Loss Equation (USLE) and the Revised Universal Soil Loss Equation (RUSLE) to predict the average annual rate of soil loss by sheet and rill erosion in tons per acre per year. The estimates are based primarily on percentage of silt, sand, and organic matter and on soil structure and permeability. Values of K range from 0.02 to 0.69. Other factors being equal, the higher the value, the more susceptible the soil is to sheet and rill erosion by water.

Erosion factor Kf indicates the erodibility of the fine-earth fraction, or the material less than 2 millimeters in size.

Erosion factor T is an estimate of the maximum average annual rate of soil erosion by wind or water that can occur without affecting crop productivity over a sustained period. The rate is in tons per acre per year.

Wind erodibility groups are made up of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible. The groups are described in the “National Soil Survey Handbook” (USDA/NRCS).

Wind erodibility index is a numerical value indicating the susceptibility of soil to wind erosion, or the tons per acre per year that can be expected to be lost to wind erosion. There is a close correlation between wind erosion and the texture of the surface layer, the size and durability of surface clods, rock fragments, organic matter, and a calcareous reaction. Soil moisture and frozen soil layers also influence wind erosion.

Chemical Properties

Table 23 shows estimates of some chemical characteristics and features that affect soil behavior. These estimates are given for the layers of each soil in the survey area.

The estimates are based on field observations and on test data for these and similar soils.

Depth to the upper and lower boundaries of each layer is indicated.

Clay as a soil separate consists of mineral soil particles that are less than 0.002 millimeter in diameter. In the table, the estimated clay content of each soil layer is given as a percentage, by weight, of the soil material that is less than 2 millimeters in diameter.

Cation-exchange capacity is the total amount of extractable bases that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. Soils having a low cation-exchange capacity hold fewer cations and may require more frequent applications of fertilizer than soils having a high cation-exchange capacity. The ability to retain cations reduces the hazard of ground-water pollution.

Effective cation-exchange capacity refers to the sum of extractable bases plus aluminum expressed in terms of milliequivalents per 100 grams of soil. It is determined for soils that have pH of less than 5.5.

Soil reaction is a measure of acidity or alkalinity. The pH of each soil horizon is based on many field tests. For many soils, values have been verified by laboratory analyses. Soil reaction is important in selecting crops and other plants, in evaluating soil amendments for fertility and stabilization, and in determining the risk of corrosion.

Calcium carbonate equivalent is the percent of carbonates, by weight, in the fraction of the soil less than 2 millimeters in size. The availability of plant nutrients is influenced by the amount of carbonates in the soil. Incorporating nitrogen fertilizer into calcareous soils helps to prevent nitrite accumulation and ammonium-N volatilization.

Gypsum is expressed as a percent, by weight, of hydrated calcium sulfates in the fraction of the soil less than 20 millimeters in size. Gypsum is partially soluble in water. Soils that have a high content of gypsum may collapse if the gypsum is removed by percolating water.

Salinity is a measure of soluble salts in the soil at saturation. It is expressed as the electrical conductivity of the saturation extract, in millimhos per centimeter at 25 degrees C. Estimates are based on field and laboratory measurements at representative sites of nonirrigated soils. The salinity of irrigated soils is affected by the quality of the irrigation water and by the frequency of water application. Hence, the salinity of soils in individual fields can differ greatly from the value given in the table. Salinity affects the suitability of a soil for crop production, the stability of soil if used as construction material, and the potential of the soil to corrode metal and concrete.

Sodium adsorption ratio (SAR) is a measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration. Soils that have SAR values of 13 or more may be characterized by an increased dispersion of organic matter and clay particles, reduced permeability and aeration, and a general degradation of soil structure.

Physical and Chemical Analyses of Selected Soils

The results of physical and chemical analyses of several typical pedons in the survey area are available on the Internet (http://ssldata.nrcs.usda.gov/querypage.asp). The data are for soils sampled at carefully selected sites. Unless otherwise indicated, the pedons are typical of the series. The following is a list of soil samples analyzed by the National Soil Survey Laboratory in Lincoln, Nebraska.

Correlated soil name: Almendra
Pedon number: 95P0513
Site ID: 95CA612004
Latitude: 39-40-25.00N

Longitude: 121-48-40.00W
Datum: NAD27
Location notes: Approximately 2,300 feet north and 2,100 feet west of the southeast corner of sec. 13, T. 21 N., R. 1 E.; about 2.0 miles north of Durham; Chico, California, Quad.
Correlated soil name: Beecee
Pedon number: 96P0141
Site ID: 615-H
Latitude: 39-57-44.82N
Longitude: 121-31-5.65W
Datum: NAD27
Location notes: Approximately 1,500 feet north and 850 feet east of the southwest corner of sec. 3, T. 24 N., R. 4 E.; about 2.2 miles southeast of Inskip; Stirling City, California, Quad.
Correlated soil name: Bigridge
Pedon number: 01N0268
Site ID: 716-L
Latitude: 39-36-41.47N
Longitude: 121-24-51.65W
Datum: NAD83
Location notes: Approximately 1,300 feet west and 750 feet south of the northeast corner of sec. 9, T. 20 N., R. 5 E.; about 6.25 miles northeast of Oroville Dam; Oroville Dam, California, Quad.
Correlated soil name: Bonepile
Pedon number: 97P0308
Site ID: 670-I
Latitude: 40-1-57.00N
Longitude: 121-31-35.30W
Datum: NAD83
Location notes: Approximately 600 feet north and 1,200 feet west of the southeast corner of sec. 9, T. 25 N., R. 4 E.; Butte Meadows, California, Quad.
Correlated soil name: Bonneyridge
Pedon number: 96P0134
Site ID: 823-Y
Latitude: 39-38-50.0N
Longitude: 121-10-49.0W
Datum: NAD27
Location notes: Approximately 2,600 feet east and 1,800 feet north of the southwest corner of sec. 27, T. 21 N., R. 7 E.; Cascade California, Quad.
Correlated soil name: Bonneyridge
Pedon number: 97P0311
Site ID: 709-K
Latitude: 39-40-26.80N
Longitude: 121-8-0.20W
Datum: NAD83
Location notes: Approximately 1,100 feet north and 650 feet east of the southwest corner of sec. 18, T. 21 N., R. 8 E.; about 3 miles southeast of Cascade; Cascade, California, Quad.
Correlated soil name: Bottlehill
Pedon number: 97P0307
Site ID: 674-I
Latitude: 40-1-18.00N
Longitude: 121-32-9.50W
Datum: NAD83

Location notes: Approximately 1,850 feet north and 1,350 feet east of the southwest corner of sec. 16, T. 25 N., R. 4 E.; Butte Meadows, California, Quad.

Correlated soil name: Busacca
Pedon number: 89P0067

Correlated soil name: Whitecabin

Pedon number: 95P0516
Site ID: 723R
Latitude: 39-35-57N
Longitude: 121-56-48W
Datum: NAD27
Location notes: About 1.7 miles southeast of Rancho Llano Seco headquarters, approximately 8,500 feet west of the Mt. Diablo meridian and 14,500 feet south of the boundary between T. 20 N. and 21 N.; in an unsectionized area in the Llano Seco Land Grant; Llano Seco, California, Quad.

Most determinations, except those for grain-size analysis and bulk density, were made on soil material smaller than 2 millimeters in diameter. Measurements reported as percent or quantity of unit weight were calculated on an ovendry basis. The methods used in obtaining the data are indicated in the list that follows. The codes in parentheses refer to published methods (USDA, 2004).

Coarse materials—(2-75 mm fraction) weight estimates of the percentages of all material less than 75 mm (3B1).
Coarse materials—(2-250 mm fraction) volume estimates of the percentages of all material greater than 2 mm (3B2).
Sand—(0.05-2.0 mm fraction) weight percentages of material less than 2 mm (3A1).
Silt—(0.002-0.05 mm fraction) pipette extraction, weight percentages of all material less than 2 mm (3A1).
Clay—(fraction less than 0.002 mm) pipette extraction, weight percentages of material less than 2 mm (3A1).
Carbonate clay—(fraction less than 0.002 mm) pipette extraction, weight percentages of material less than 2 mm (3A1d).
Water retained—pressure extraction, percentage of ovendry weight of less than 2 mm material; 1/3 or 1/10 bar (4B1), 15 bars (4B2).
Water-retention difference—between 1/3 bar and 15 bars for whole soil (4C1).
Water-retention difference—between 1/10 bar and 15 bars for whole soil (4C2).
Bulk density—of less than 2 mm material, saran-coated clods field moist (4A1a), 1/3 bar (4A1d), ovendry (4A1h).
Moist bulk density—of less than 2 mm material, cores (4A3).
Moist bulk density—of less than 2 mm material, compliant cavity (4A5).
Linear extensibility—change in clod dimension based on whole soil (4D).
Organic carbon—wet combustion. Walkley-Black modified acid-dichromate, ferric sulfate titration (6A1c).
Organic carbon—dry combustion (6A2d).

Total nitrogen—Kjeldahl (6B3).
Extractable cations—ammonium acetate pH 7.0, ICP; calcium (6N2i), magnesium (6O2h), sodium (6P2f), potassium (6Q2f).
Extractable cations—ammonium acetate pH 7.0, EDTA-alcohol separation; calcium (6N2a), magnesium (6O2a); flame photometry; sodium (6P2a), potassium (6Q2a).
Extractable acidity—barium chloride-triethanolamine IV (6H5a).
Cation-exchange capacity—ammonium acetate, pH 7.0, steam distillation (5A8b).
Cation-exchange capacity—sum of cations (5A3a).
Effective cation-exchange capacity—sum of extractable cations plus aluminum (5A3b).
Base saturation—ammonium acetate, pH 7.0 (5C1).
Base saturation—sum of cations, TEA, pH 8.2 (5C3).
Reaction (pH)—1:1 water dilution (8C1f).
Reaction (pH)—saturated paste (8C1b).
Reaction (pH)—potassium chloride (8C1g).
Reaction (pH)—sodium fluoride (8C1d).
Reaction (pH)—calcium chloride (8C1f).
Aluminum—potassium chloride extraction (6G9c).
Aluminum—acid oxalate extraction (6G12b).
Iron—acid oxalate extraction (6C9b).
Silica—acid oxalate extraction (6V2b).
Sesquioxides—dithionate-citrate extract; iron (6C2h), aluminum (6G7b), manganese (6D2g).
Soil resistivity—saturated paste (8E1).
Total soluble salts—estimate from resistivity (8A2).
Total soluble salts—estimate from conductivity (8D5).
Carbonate as calcium carbonate—(fraction less than 2 mm [80 mesh]) manometric (6E1h).
Carbonate as calcium carbonate—(fraction less than 20 mm) manometric (6E4).
Gypsum—precipitation in acetone (6F1a).
Soluble ions—acid titration, saturated paste; carbonate (6I1b), bicarbonate (6J1b).
Soluble ions—anion chromatograph, saturated paste; chloride (6K1f), sulfate (6L1f), nitrate (6M1f); fluoride (6U1d); nitrite (6W1d).
Electrical conductivity—saturation extract (8A3a).
Sodium adsorption ratio (5E).
Extractable phosphorus—Bray P-1 (6S3).
Available phosphorus—(method of reporting laboratory).

Water Features

Table 24 gives estimates of various water features. The estimates are used in land use planning that involves engineering considerations.

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The four hydrologic soil groups are:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

The *months* in the table indicate the portion of the year in which the feature is most likely to be a concern.

Water table refers to a saturated zone in the soil. Table 24 indicates, by month, depth to the top (*upper limit*) and base (*lower limit*) of the saturated zone in most years. Estimates of the upper and lower limits are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors or mottles (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

Ponding is standing water in a closed depression. Unless a drainage system is installed, the water is removed only by percolation, transpiration, or evaporation. Table 24 indicates *surface water depth* and the *duration* and *frequency* of ponding. Duration is expressed as *very brief* if less than 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, rare, occasional, and frequent. *None* means that ponding is not probable; *rare* that it is unlikely but possible under unusual weather conditions (the chance of ponding is nearly 0 percent to 5 percent in any year); *occasional* that it occurs, on the average, once or less in 2 years (the chance of ponding is 5 to 50 percent in any year); and *frequent* that it occurs, on the average, more than once in 2 years (the chance of ponding is more than 50 percent in any year).

Flooding is the temporary inundation of an area caused by overflowing streams, by runoff from adjacent slopes, or by tides. Water standing for short periods after rainfall or snowmelt is not considered flooding, and water standing in swamps and marshes is considered ponding rather than flooding.

Duration and *frequency* are estimated. Duration is expressed as *extremely brief* if 0.1 hour to 4 hours, *very brief* if 4 hours to 2 days, *brief* if 2 to 7 days, *long* if 7 to 30 days, and *very long* if more than 30 days. Frequency is expressed as none, very rare, rare, occasional, frequent, and very frequent. *None* means that flooding is not probable; *very rare* that it is very unlikely but possible under extremely unusual weather conditions (the chance of flooding is less than 1 percent in any year); *rare* that it is unlikely but possible under unusual weather conditions (the chance of flooding is 1 to 5 percent in any year); *occasional* that it occurs infrequently under normal weather conditions (the chance of flooding is 5 to 50 percent in any year); *frequent* that it is likely to occur often under normal weather conditions (the chance of flooding is more than 50 percent in any year but is less than 50 percent in all months in any year); and *very frequent* that it is likely to occur very often under normal weather conditions (the chance of flooding is more than 50 percent in all months of any year).

The information is based on evidence in the soil profile, namely thin strata of gravel, sand, silt, or clay deposited by floodwater; irregular decrease in organic matter content with increasing depth; and little or no horizon development.

Also considered are local information about the extent and levels of flooding and the relation of each soil on the landscape to historic floods. Information on the extent of flooding based on soil data is less specific than that provided by detailed engineering surveys that delineate flood-prone areas at specific flood frequency levels.

Soil Features

Table 25 gives estimates of various soil features. The estimates are used in land use planning that involves engineering considerations.

A *restrictive layer* is a nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly impede the movement of water and air through the soil or that restrict roots or otherwise provide an unfavorable root environment. Examples are bedrock, cemented layers, dense layers, and frozen layers. The table indicates the hardness and thickness of the restrictive layer, both of which significantly affect the ease of excavation. *Depth to top* is the vertical distance from the soil surface to the upper boundary of the restrictive layer.

Potential for frost action is the likelihood of upward or lateral expansion of the soil caused by the formation of segregated ice lenses (frost heave) and the subsequent collapse of the soil and loss of strength on thawing. Frost action occurs when moisture moves into the freezing zone of the soil. Temperature, texture, density, permeability, content of organic matter, and depth to the water table are the most important factors considered in evaluating the potential for frost action. It is assumed that the soil is not insulated by vegetation or snow and is not artificially drained. Silty and highly structured, clayey soils that have a high water table in winter are the most susceptible to frost action. Well drained, very gravelly, or very sandy soils are the least susceptible. Frost heave and low soil strength during thawing cause damage to pavements and other rigid structures.

Risk of corrosion pertains to potential soil-induced electrochemical or chemical action that corrodes or weakens uncoated steel or concrete. The rate of corrosion of uncoated steel is related to such factors as soil moisture, particle-size distribution, acidity, and electrical conductivity of the soil. The rate of corrosion of concrete is based mainly on the sulfate and sodium content, texture, moisture content, and acidity of the soil. Special site examination and design may be needed if the combination of factors results in a severe hazard of corrosion. The steel or concrete in installations that intersect soil boundaries or soil layers is more susceptible to corrosion than the steel or concrete in installations that are entirely within one kind of soil or within one soil layer.

For uncoated steel, the risk of corrosion, expressed as *low, moderate,* or *high,* is based on soil drainage class, total acidity, electrical resistivity near field capacity, and electrical conductivity of the saturation extract.

For concrete, the risk of corrosion also is expressed as *low, moderate,* or *high*. It is based on soil texture, acidity, and amount of sulfates in the saturation extract.

Classification of the Soils

The system of soil classification used by the National Cooperative Soil Survey has six categories (Soil Survey Staff, 1999 and 2003). Beginning with the broadest, these categories are the order, suborder, great group, subgroup, family, and series. Classification is based on soil properties observed in the field or inferred from those observations or from laboratory measurements. Table 26 shows the classification of the soils in the survey area, and table 27 arranges the taxonomic units by order, suborder, great group, and subgroup. The categories are defined in the following paragraphs.

ORDER. Twelve soil orders are recognized. The differences among orders reflect the dominant soil-forming processes and the degree of soil formation. Each order is identified by a word ending in *sol*. An example is Alfisol.

SUBORDER. Each order is divided into suborders primarily on the basis of properties that influence soil genesis and are important to plant growth or properties that reflect the most important variables within the orders. The last syllable in the name of a suborder indicates the order. An example is Xeralf (*Xer*, meaning dry, plus *alf*, from Alfisol).

GREAT GROUP. Each suborder is divided into great groups on the basis of close similarities in kind, arrangement, and degree of development of pedogenic horizons; soil moisture and temperature regimes; type of saturation; and base status. Each great group is identified by the name of a suborder and by a prefix that indicates a property of the soil. An example is Durixeralfs (*Duri*, meaning hard, plus *xeralf*, the suborder of the Alfisols that has a xeric moisture regime).

SUBGROUP. Each great group has a typic subgroup. Other subgroups are intergrades or extragrades. The typic subgroup is the central concept of the great group; it is not necessarily the most extensive. Intergrades are transitions to other orders, suborders, or great groups. Extragrades have some properties that are not representative of the great group but do not indicate transitions to any other taxonomic class. Each subgroup is identified by one or more adjectives preceding the name of the great group. The adjective *Typic* identifies the subgroup that typifies the great group. An example is Typic Durixeralfs.

FAMILY. Families are established within a subgroup on the basis of physical and chemical properties and other characteristics that affect management. Generally, the properties are those of horizons below plow depth where there is much biological activity. Among the properties and characteristics considered are particle-size class, mineralogy class, cation-exchange activity class, soil temperature regime, soil depth, and reaction class. A family name consists of the name of a subgroup preceded by terms that indicate soil properties. An example is loamy-skeletal, mixed, superactive, thermic, shallow Typic Durixeralfs.

SERIES. The series consists of soils within a family that have horizons similar in color, texture, structure, reaction, consistence, mineral and chemical composition, and arrangement in the profile. An example is the Redswale series.

Soil Series and Their Morphology

In this section, each soil series recognized in the survey area is described. Characteristics of the soil and the material in which it formed are identified for each series. A pedon, a small three-dimensional area of soil, that is typical of the series in the survey area is described. The detailed description of each soil horizon follows standards in the “Soil Survey Manual” (Soil Survey Division Staff, 1993) and in the “Field Book for Describing and Sampling Soils” (Schoeneberger and others, 2002). Many of the technical terms used in the descriptions are defined in “Soil Taxonomy” (Soil Survey Staff, 1999) and in “Keys to Soil Taxonomy” (Soil Survey Staff, 2003). Unless otherwise indicated, colors in the descriptions are for dry soil. Following the pedon description is the range of important characteristics of the soils in the series.

Almendra Series

The Almendra series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on alluvial fans. Slopes are 0 to 1 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Pachic Haploxerolls

Typical Pedon

Almendra loam, on a southwest-facing slope of 1 percent, in a leveled fallow field, under a cover of annual grasses, at an elevation of 180 feet (55 m). When described on 5/8/1995, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.

Ap1—0 to 4 inches (0 to 10 cm); brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; 23 percent clay; moderate medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, very friable, nonsticky, slightly plastic; few fine and medium and common very fine roots; few very fine to medium tubular pores; 3 percent gravel; moderately acid, pH 5.8 by pH meter 1:1 water; clear smooth boundary.

Ap2—4 to 14 inches (10 to 36 cm); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; 24 percent clay; moderate medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, very friable, nonsticky, slightly plastic; common very fine to medium roots; common fine and medium and many very fine tubular pores; fine spherical wormcasts throughout; 3 percent gravel; slightly acid, pH 6.3 by pH meter 1:1 water; clear smooth boundary.

Bw1—14 to 29 inches (36 to 74 cm); brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; 20 percent clay; moderate medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, very friable, nonsticky, slightly plastic; few fine and medium and common very fine roots; common fine and medium tubular, many very fine tubular, and common very fine to medium irregular pores; fine spherical wormcasts throughout; 5 percent gravel; neutral, pH 6.6 by pH meter 1:1 water; clear wavy boundary.

Bw2—29 to 40 inches (74 to 102 cm); brown (10YR 5/3) loam, dark brown (7.5YR 3/2) moist; 17 percent clay; moderate medium subangular blocky structure parting to moderate very fine and fine granular; slightly hard, very friable, nonsticky, slightly plastic; few fine and medium and common very fine roots; many very fine to medium irregular and tubular pores; 35 percent fine irregular brown (7.5YR 4/4 moist) oxidized iron masses lining pores; fine spherical wormcasts throughout; 4 percent gravel; neutral, pH 7.2 by pH meter 1:1 water; clear wavy boundary.

Bw3—40 to 52 inches (102 to 132 cm); brown (10YR 5/3) loam, brown (7.5YR 4/2) moist; 16 percent clay; moderate medium subangular blocky structure parting to moderate very fine and fine subangular blocky; slightly hard, very friable, nonsticky, slightly plastic; few fine and medium and common very fine roots; many very fine to medium tubular and irregular pores; 5 percent fine irregular brown (7.5YR 4/4 moist) oxidized iron masses lining pores; 65 percent fine irregular dark gray (10YR 4/1 moist) iron depletions on faces of peds and lining pores; 3 percent gravel; neutral, pH 7.3 by pH meter 1:1 water; clear wavy boundary.

Bw4—52 to 74 inches (132 to 188 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 4/3) moist; 15 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular and irregular pores; 35 percent fine and medium irregular light brownish gray (10YR 6/2 moist) iron depletions lining pores; 1 percent gravel; slightly alkaline, pH 7.4 by pH meter 1:1 water; clear smooth boundary.

Bw5—74 to 86 inches (188 to 218 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 4/3) moist; 13 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky, slightly plastic; few very fine roots; many very fine to medium tubular and irregular pores; 2 percent fine irregular black (N 2/0 moist) manganese masses throughout; 10 percent fine irregular brown (7.5YR 5/2 moist) iron depletions lining pores; 1 percent gravel; slightly alkaline, pH 7.4 by pH meter 1:1 water.

Type location: Butte County, California; about 2.0 miles north of Durham, approximately 2,300 feet north and 2,100 feet west of the southeast corner of sec. 13, T. 21 N., R. 1 E.; 39 degrees, 40 minutes, 25 seconds north latitude and 121 degrees, 48 minutes, 40 seconds west longitude; NAD27; USGS Quad: Chico, California.

Range in Characteristics

The thickness of the solum is more than 72 inches (183 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 140 to 160 days). The particle-size control section averages 18 to 27 percent clay and 0 to 5 percent rock fragments, mostly fine gravel. Mineralogy is mixed. Redoximorphic features, such as oxidized iron masses, iron depletions, and manganese masses, occur below a depth of 29 inches (74 cm). The content of organic matter is 1.2 to 4.6 percent from 0 to 40 inches (0 to 102 cm) and 0.34 to 0.84 percent from 40 to 86 inches (102 to 218 cm). By ammonium acetate, base saturation ranges from 97 to 100 percent and CEC ranges from 19.3 to 28.

The Ap horizon has dry color of 10YR 5/2, 5/3, 4/2, or 4/3. Moist color is 10YR 3/2, 3/3, 2/1, or 2/2. Texture is loam or fine sandy loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 0 to 5 percent. Reaction ranges from moderately acid to slightly alkaline.

The Bw1 and Bw2 horizons have dry color of 10YR 5/2 or 5/3. Moist color is 10YR 3/2, 3/3, 4/2, or 4/3 or 7.5YR 3/2. Texture is loam or fine sandy loam. The content of clay ranges from 17 to 27 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bw3 horizon has dry color of 10YR 5/2, 5/3, 5/4, or 6/3. Moist color is 10YR 4/2, 4/3, 4/4, or 5/2. Texture is loam or fine sandy loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bw4 and Bw5 horizons have dry color of 10YR 4/3, 6/3, or 6/4 or 7.5YR 6/3 or 6/4. Moist color is 7.5YR 4/3 or 4/4 or 10YR 4/2, 4/3, 4/4, or 5/2. Texture is loam, sandy loam, fine sandy loam, or very fine sandy loam. The content of clay ranges

from 12 to 25 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

Anita Series

The Anita series consists of shallow, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in swales, in basins, and along drainageways on strath terraces on Cascade foothills and fan terraces. Slopes range from 0 to 3 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Clayey, smectitic, thermic, shallow Xeric Duraquerts

Typical Pedon

Anita clay, on a slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 250 feet (76 m). (Colors are for dry soil unless otherwise noted.)

A1—0 to 1 inch (0 to 3 cm); dark gray (5YR 4/1) clay, very dark gray (5YR 3/1) moist; 48 percent clay; strong medium granular structure; extremely hard, very firm, very sticky, very plastic; many very fine roots; many fine pores; slightly acid, pH 6.3 by pH meter 1:1 water; abrupt wavy boundary.

A2—1 to 3 inches (3 to 8 cm); dark gray (5YR 4/1) clay, very dark gray (5YR 3/1) moist; 52 percent clay; strong medium angular blocky structure; extremely hard, very firm, very sticky, very plastic; many fine roots; many fine pores; moderately acid, pH 6.0 by pH meter 1:1 water; abrupt wavy boundary.

Bss1—3 to 10 inches (8 to 25 cm); dark gray (5YR 4/1) clay, very dark gray (5YR 3/1) moist; 53 percent clay; weak medium prismatic structure; extremely hard, very firm, very sticky, very plastic; many very fine roots; many fine pores; common slickensides; moderately acid, pH 6.0 by pH meter 1:1 water; clear wavy boundary.

Bss2—10 to 15 inches (25 to 38 cm); dark gray (5YR 4/1) clay, very dark gray (5YR 3/1) moist; 54 percent clay; massive when moist and strong coarse prismatic structure when dry; extremely hard, very firm, very sticky, very plastic; few very fine roots; few fine pores; common slickensides; slightly acid, pH 6.2 by pH meter 1:1 water; abrupt wavy boundary.

2Bkqm—15 to 20 inches (38 to 51 cm); brown (10YR 5/3) and very pale brown (10YR 7/4), indurated duripan; weak platy structure; interbedded with clay in the upper part; weakly calcareous; slightly alkaline, pH 7.5 by pH meter 1:1 water.

Type location: Tehama County, California; about 3.1 miles southeast of Vina, 1.5 miles north of the Butte County line, approximately 2,640 feet west and 1,320 feet north of southeast corner of sec. 29, T. 29 N., R. 1 E.; 39 degrees, 54 minutes, 7 seconds north latitude and 122 degrees, 0 minutes, 7 seconds west longitude; NAD27; USGS Quad: Vina, California.

Range in Characteristics

Depth to the duripan is 10 to 20 inches (25 to 51 cm). The duripan is underlain by volcanic sediments derived from tuffaceous rocks or volcanic sandstone. The mean annual soil temperature ranges from 63 to 66 degrees F (17 to 19 degrees C). The soils usually are dry by about June 15 and remain dry until September 15. The particle-size control section averages 45 to 55 percent clay and 0 to 25 percent rock fragments, mostly gravel and cobbles. Mineralogy is smectitic. Surface-initiated, reversible cracks 1/4 inch to 2 inches (0.6 to 5 cm) wide extend from the surface to the duripan from July through October. The surface commonly has hoof prints up to 6 inches (15 cm) or more deep. A fluctuating water table can occur between the top of

the duripan and the surface of the soil from November through May. Rock fragments on the surface range from 15 to 25 percent rounded cobbles, 0 to 10 percent rounded gravel, and 0 to 2 percent stones. Some pedons are directly underlain by sandstone or volcanic sediments with a discontinuous silica-cemented capping.

The A horizon has dry color of 10YR 4/2 or 5/2; 7.5YR 3/1, 4/1, 4/2, 5/2, or 6/2; or 5YR 4/1. Moist color is 10YR 3/2 or 4/2; 7.5YR 3/1, 3/2, or 4/2; or 5YR 2/2 or 3/1. Texture is gravelly clay, cobbly clay, or clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 20 percent. The content of cobbles also is 0 to 20 percent. The content of organic matter is 2 to 5 percent. Redoximorphic features range from 0 to 20 percent manganese masses and 0 to 5 percent oxidized iron masses. Reaction ranges from moderately acid to moderately alkaline.

The Bss horizon has dry color of 10YR 4/1 or 5/2, 7.5YR 4/2, or 5YR 4/1 or 5/1. Moist color is 10YR 3/2 or 4/1, 7.5YR 4/2 or 4/3, or 5YR 3/1 or 3/2. Texture is gravelly clay, cobbly clay, very cobbly clay, or clay. The content of clay ranges from 50 to 60 percent. The content of gravel is 0 to 35 percent, and the content of cobbles is 0 to 25 percent. The content of organic matter is 0.5 to 2 percent. The horizon has few or common slickensides and/or wedge-shaped aggregates. Redoximorphic features range from 0 to 20 percent manganese masses and from 0 to 5 percent oxidized iron masses. Reaction ranges from moderately acid to slightly alkaline.

The 2Bkqm horizon commonly has a manganese capping 1/4 to 3/8 inch (0.6 to 0.95 cm) thick. The content of gravel is 0 to 80 percent. The content of cobbles also is 0 to 80 percent.

Anita Taxadjunct

The Anita taxadjunct consists of shallow, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in areas of small basins, drainageways, toeslopes, footslopes, and saddles on Cascade foothills. Slopes range from 0 to 12 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Clayey, smectitic, thermic, shallow Vertic Endoaquepts

Typical Pedon

Anita taxadjunct, on a northwest-facing slope of 1 percent, under a cover of ryegrass and vinegarweed, at an elevation of 235 feet (72 meters). When described on 4/16/2001, the soil was dry to a depth of 2 inches (5 cm) and slightly moist from 2 to 11 inches (5 to 28 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/2) clay, brown (7.5YR 4/2) moist; 55 percent clay; strong medium and coarse subangular blocky structure; very rigid, friable, very sticky, very plastic; many very fine roots; few very fine tubular and common very fine to coarse irregular pores; 5 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bg—2 to 6 inches (5 to 15 cm); dark gray (5YR 4/1) clay, dark reddish gray (5YR 4/2) moist; 60 percent clay; moderate coarse prismatic structure parting to strong medium and coarse angular blocky; very rigid, friable, very sticky, very plastic; common very fine roots; few very fine tubular and common very fine to medium irregular pores; 5 percent gravel; neutral, pH 6.8 by Hellige-Truog; gradual smooth boundary.

Bssg—6 to 11 inches (15 to 28 cm); dark gray (5YR 4/1) clay, dark reddish gray (5YR 4/2) moist; 60 percent clay; moderate coarse prismatic structure parting to strong medium and coarse angular blocky; very rigid, friable, very sticky, very plastic; common very fine roots; few very fine tubular and common very fine to medium irregular pores; 25 percent slickensides and 20 percent wedge-shaped

aggregates; 5 percent gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Cr—11 inches (28 cm); very pale brown (10YR 8/3), moderately cemented volcanic sandstone bedrock, yellowish brown (10YR 5/4) moist; a manganese cap, 2 mm thick, on top of the horizon; slightly alkaline, pH 7.6 by Hellige-Truog.

Type location: Butte County, California; about 0.75 mile northeast of the intersection of Highways 99 and 149, approximately 50 feet south and 2,350 feet west of the northeast corner of sec. 6, T. 20 N., R. 3 E.; 39 degrees, 37 minutes, 29 seconds north latitude and 121 degrees, 40 minutes, 42 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 60 to 68 degrees F (16 to 20 degrees C). The soil moisture control section is dry in all parts from about June through October (about 150 days). The particle-size control section averages 50 to 60 percent clay and 2 to 10 percent rock fragments, mostly gravel. Mineralogy is smectitic. Surface-initiated, reversible cracks 1 to 2 inches (2.5 to 5 cm) wide extend to a depth of 10 to 20 inches (25 to 51 cm) from April to November. A fluctuating water table can occur between the top of the bedrock and the surface of the soil from November through May. Redoximorphic features, such as iron concentrations, occur in the A horizon, and a manganese capping occurs on top of the 2Cr horizon. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 10 percent cobbles.

The A horizon has dry color of 10YR 4/1, 5/1, or 7/2 or 7.5YR 5/2. Moist color is 10YR 4/1 or 4/2 or 7.5YR 4/2. Texture is clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 10 percent. Reaction ranges from slightly acid to moderately alkaline.

The Bg horizon has dry color of 10YR 4/1 or 4/2, 7.5YR 4/2, or 5YR 4/1. Moist color is 10YR 4/1 or 4/2, 7.5YR 4/1, or 5YR 4/2. Texture is clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 10 percent. Reaction ranges from neutral to moderately alkaline.

The Bssg horizon has dry color of 10YR 4/1, 7.5YR 4/2, or 5YR 4/1. Moist color is 10YR 4/1, 7.5YR 4/1, or 5YR 4/2. Texture is clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 10 percent. Reaction ranges from neutral to moderately alkaline.

The Anita taxadjunct is a taxadjunct because it is underlain by paralithic bedrock instead of a duripan. This difference does not significantly affect the use, management, or interpretations of the soils.

Aquic Xerofluvents

Aquic Xerofluvents consist of very deep, poorly drained soils that formed in alluvium derived from granitic and volcanic rocks. These soils are in meadows in Sierra Nevada mountain valleys. Slopes range from 0 to 8 percent. The mean annual precipitation is about 80 inches (2,030 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Coarse-loamy, mixed, active, nonacid Aquic Xerofluvents

Typical Pedon

Aquic Xerofluvents, on a south-southwest-facing slope of 4 percent, under a cover of *Carex*, *Juncus*, aster, corn lily, alder, and willow, at an elevation of 4,250 feet (1,295 m). When described on 9/16/1999, the soil was dry to a depth of 49 inches (124 cm) and slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); dark grayish brown (10YR 4/2) peaty very fine sandy loam, very dark brown (10YR 2/2) moist; 4 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium irregular and tubular pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

A2—3 to 7 inches (8 to 18 cm); dark gray (10YR 4/1) mucky fine sandy loam, very dark gray (10YR 3/1) moist; 4 percent clay; weak fine and medium granular structure; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium tubular and irregular pores; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

C—7 to 16 inches (18 to 41 cm); light gray (10YR 7/2) gravelly coarse sandy loam, grayish brown (10YR 5/2) moist; 4 percent clay; single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium interstitial and tubular pores; 30 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; abrupt smooth boundary.

Ab—16 to 19 inches (41 to 48 cm); gray (10YR 5/1) mucky fine sandy loam, black (10YR 2/1) moist; 6 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine and common medium tubular pores; 2 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

C´—19 to 23 inches (48 to 58 cm); light brownish gray (10YR 6/2) gravelly sandy loam, dark grayish brown (10YR 4/2) moist; 2 percent clay; single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium interstitial and tubular pores; 15 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; abrupt smooth boundary.

A´b—23 to 35 inches (58 to 89 cm); dark gray (10YR 4/1) mucky very fine sandy loam, black (10YR 2/1) moist; 4 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine tubular pores; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

C´´—35 to 49 inches (89 to 124 cm); very gravelly loamy coarse sand; 2 percent clay; single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium interstitial and tubular pores; 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

A´´b—49 to 63 inches (124 to 160 cm); dark grayish brown (10YR 4/2) peaty fine sandy loam, very dark gray (10YR 3/1) moist; 4 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

C´´´—63 to 71 inches (160 to 180 cm); gravelly loamy coarse sand; 2 percent clay; single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium interstitial and tubular pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

A´´´b—71 to 80 inches (180 to 203 cm); dark gray (10YR 4/1) mucky fine sandy loam, black (10YR 2/1) moist; 4 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine tubular pores; 1 percent gravel; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Plumas County, California; about 0.2 mile southeast of Campbell Cow Camp, approximately 1,200 feet south and 700 feet east of the center of sec. 14, T. 24 N., R. 5 E.; 39 degrees, 56 minutes, 1 second north latitude and 121 degrees, 22 minutes, 44 seconds west longitude; NAD27; USGS Quad: Kimshew Point, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil moisture control

section is dry in all parts from about August to October (about 90 days). The particle-size control section averages 2 to 6 percent clay and 2 to 25 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur from the surface of the soil to 43 inches (109 cm) below the surface from December through June and from 17 to 98 inches (43 to 250 cm) below the surface from July through November. Rock fragments on the surface range from 0 to 20 percent gravel.

The A horizon has dry color of 10YR 4/2 or 4/1. Moist color is 10YR 2/1 or 3/1. Texture is peaty very fine sandy loam, mucky very fine sandy loam, peaty fine sandy loam, or mucky fine sandy loam. The content of clay ranges from 2 to 6 percent. The content of gravel is 0 to 5 percent. Reaction is slightly acid.

The C horizon has dry color of 10YR 6/2 or the color of the fresh mineral grains. Moist color is 10YR 4/2 or the color of the fresh mineral grains. Texture is gravelly coarse sandy loam, gravelly sandy loam, very gravelly loamy coarse sand, or gravelly loamy coarse sand. The content of clay ranges from 2 to 6 percent. The content of gravel is 15 to 45 percent. Reaction is slightly acid.

The Ab horizon has dry color of 10YR 4/1, 4/2, or 5.1. Moist color is 10YR 2/1 or 3/1. Texture is mucky fine sandy loam, mucky very fine sandy loam, or fine sandy loam. The content of clay ranges from 2 to 6 percent. The content of gravel is 0 to 5 percent. Reaction is slightly acid.

Arbuckle Series

The Arbuckle series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on low terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 19 inches (483 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Arbuckle gravelly loam, on a slope of 1 percent, under a cover of annual grasses, at an elevation of 110 feet (33 m). When described on 5/29/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A1—0 to 4 inches (0 to 11 cm); brown (10YR 5/3) gravelly loam, brown (10YR 4/3) moist; 20 percent clay; strong fine and medium subangular blocky structure; hard, friable, nonsticky, slightly plastic; many very fine and fine and common medium roots; common very fine and fine tubular pores; 15 percent subrounded gravel; neutral, pH 7.0 by Hellige-Truog; abrupt wavy boundary.

A2—4 to 9 inches (11 to 23 cm); light yellowish brown (10YR 6/4) gravelly loam, brown (10YR 4/3) moist; 23 percent clay; moderate medium subangular blocky structure; very hard, friable, nonsticky, slightly plastic; common very fine to medium roots; common fine and medium tubular pores; 2 percent patchy faint clay films in root channels and/or pores; 15 percent subrounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual wavy boundary.

Bt1—9 to 20 inches (23 to 51 cm); light yellowish brown (10YR 6/4) gravelly loam, dark grayish brown (10YR 4/2) moist; 24 percent clay; moderate medium and coarse subangular blocky structure; very hard, firm, slightly sticky, slightly plastic; common very fine to medium roots; common fine and medium tubular pores; 30 percent discontinuous distinct clay films throughout; 15 percent subrounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual wavy boundary.

Bt2—20 to 32 inches (51 to 81 cm); light yellowish brown (10YR 6/4) loam, dark grayish brown (10YR 4/2) moist; 24 percent clay; moderate medium and coarse subangular blocky structure; very hard, friable, slightly sticky, slightly plastic; few very fine and fine and common fine and medium roots; common fine and medium

tubular pores; 35 percent discontinuous distinct clay films throughout; 10 percent subrounded gravel; slightly alkaline, pH 7.5 by Hellige-Truog; gradual wavy boundary.

Bt3—32 to 49 inches (81 to 125 cm); yellowish brown (10YR 5/4) gravelly loam, brown (10YR 4/3) moist; 24 percent clay; moderate medium subangular blocky structure; very hard, friable, slightly sticky, slightly plastic; few very fine to medium roots; common fine tubular pores; 25 percent discontinuous distinct clay films throughout; 15 percent subrounded gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear wavy boundary.

2Bt4—49 to 68 inches (125 to 173 cm); brown (7.5YR 5/4) very gravelly sandy clay loam, brown (7.5YR 4/3) moist; 26 percent clay; moderate medium subangular blocky structure; extremely hard, firm, slightly sticky, slightly plastic; few very fine to medium roots; common fine tubular pores; 40 percent continuous prominent clay films throughout; 55 percent subrounded gravel; slightly alkaline, pH 7.5 by Hellige-Truog; gradual wavy boundary.

2Bt5—68 to 86 inches (173 to 219 cm); brown (7.5YR 5/4) very gravelly sandy clay loam, brown (7.5YR 4/3) moist; 21 percent clay; weak medium and coarse subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine to medium roots; few very fine tubular pores; 55 percent continuous prominent clay films throughout; 50 percent subrounded gravel; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California, United States Fish and Wildlife Service at Rancho Llano Seco, empty lot west of swallow barn; about 1.9 miles southeast of Rancho Llano Seco headquarters; approximately 7,400 feet west of 7 Mile Lane and 14,200 feet south of the line between T. 21 N. and T. 20 N.; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 35 minutes, 5 seconds north latitude and 121 degrees, 56 minutes, 8 seconds west longitude; NAD83; USGS Quad: Llano Seco, California.

Range in Characteristics

The thickness of the solum is more than 85 inches (216 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 24 to 27 percent clay and 10 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. The estimated content of organic matter is 0.5 to 0.8 percent to a depth of 9 inches (23 cm) and less than 0.5 percent below that depth. By sum of cations, base saturation is assumed to be more than 75 percent throughout the profile. Rock fragments on the surface range from 0 to 20 percent gravel, mostly quartz and chert.

The A horizon has dry color of 10YR 5/3, 6/2, 6/3, or 6/4. Moist color is 10YR 2/2, 3/1, 4/2, or 4/3. Texture is gravelly loam. The content of clay ranges from 20 to 24 percent. The content of gravel, mostly quartz and chert, ranges from 15 to 30 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/4, 6/4, or 7/4. Moist color is 10YR 4/2 or 4/3 or 7.5YR 4/3 or 5/4. Texture is gravelly loam, loam, or clay loam. The content of clay ranges from 24 to 35 percent. The content of gravel is 10 to 30 percent. Reaction ranges from slightly acid to slightly alkaline.

The 2Bt or BC horizon has dry color of 7.5YR 5/4 or 6/4. Moist color is 7.5YR 4/3 or 5/4. Texture is very gravelly or extremely gravelly sandy clay loam. The content of clay ranges from 21 to 26 percent. The content of gravel is 45 to 80 percent. Reaction is slightly alkaline.

Argonaut Taxadjunct

The Argonaut taxadjunct consists of moderately deep, well drained soils that formed in colluvium and residuum derived from mixed metavolcanic and metamorphosed intrusive igneous rocks. These soils are on metamorphic Sierra Nevada foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Argonaut loam, on a south-facing slope of 13 percent, under a cover of blue oak, foothill pine, wild oat, and annual ryegrass, at an elevation of 580 feet (177 m). When described on 5/22/2000, the soil was dry to a depth of 8 inches (20 cm) and moist from 8 to 30 inches (20 to 76 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/4) moist; 18 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many very fine roots throughout; many very fine and fine tubular pores; 10 percent fine spherical yellowish red (5YR 5/6 dry) oxidized iron masses throughout; 2 percent subangular quartz gravel and 8 percent subangular metavolcanic gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); brown (7.5YR 4/4) clay loam, dark reddish brown (5YR 3/4) moist; 29 percent clay; moderate very fine and fine subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; many very fine roots throughout; many very fine and fine tubular pores; 15 percent discontinuous distinct clay films on faces of peds; 2 percent subangular quartz gravel and 8 percent subangular metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

Bt2—8 to 14 inches (20 to 36 cm); brown (7.5YR 4/4) clay, dark reddish brown (5YR 3/4) moist; 43 percent clay; strong very fine and fine subangular blocky structure; very hard, firm, very sticky, very plastic; common fine, few coarse, and many very fine roots throughout; many very fine and fine and common medium tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 2 percent subangular quartz gravel and 8 percent subangular metavolcanic gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt wavy boundary.

Bt3—14 to 20 inches (36 to 51 cm); brown (7.5YR 4/4) clay, dark reddish brown (5YR 3/4) moist; 45 percent clay; strong fine and medium subangular blocky structure; very hard, very firm, very sticky, very plastic; few medium and many very fine roots throughout; many very fine and fine tubular pores; 40 percent discontinuous distinct clay films on faces of peds; 1 percent subangular quartz gravel and 4 percent subangular metavolcanic gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

BCt1—20 to 26 inches (51 to 66 cm); strong brown (7.5YR 5/6) clay, yellowish red (5YR 4/6) moist; 40 percent clay; strong fine and medium subangular blocky structure; hard, firm, very sticky, very plastic; common fine, few medium, and few very fine roots throughout; common fine and many very fine tubular pores; 10 percent slickensides and 40 percent discontinuous prominent clay films on faces of peds; 1 percent subangular quartz gravel and 4 percent subangular metavolcanic gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

BCt2—26 to 30 inches (66 to 76 cm); yellowish brown (10YR 5/6) clay loam, strong brown (7.5YR 4/6) moist; 36 percent clay; moderate fine and medium subangular

blocky structure; moderately hard, firm, moderately sticky, moderately plastic; common very fine and fine and few medium roots throughout; many very fine tubular pores; 4 percent slickensides and 20 percent discontinuous distinct clay films on faces of peds; 1 percent subangular quartz gravel and 4 percent subangular metavolcanic gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual wavy boundary.

Cr—30 inches (76 cm); moderately cemented metamorphic bedrock; few fine and medium roots on top of the horizon.

Type location: Butte County, California; about 2.2 miles northwest of Bangor, approximately 400 feet north and 350 feet east of the southwest corner of sec. 20, T. 18 N., R. 5 E.; 39 degrees, 23 minutes, 49.88 seconds north latitude and 121 degrees, 26 minutes, 36.37 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to paralithic bedrock is 20 is 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 35 to 50 percent clay and 5 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 4/4, 4/6, or 5/4 or 5YR 4/6. Moist color is 7.5YR 3/4 or 5YR 4/4. Texture is loam or clay loam. The content of clay ranges from 18 to 30 percent. The content of gravel is 5 to 10 percent. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 2 to 6 percent. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 7.5YR 4/4, 4/6, or 5/6 or 5YR 4/6 or 5/6. Moist color is 5YR 3/4 or 4/4. Texture is clay loam. The content of clay ranges from 28 to 40 percent. The content of gravel is 5 to 12 percent. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 1 to 3 percent. Reaction ranges from moderately acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/4, 4/6, or 5/6/ or 5YR 4/6 or 5/6. Moist color is 5YR 3/4 or 4/4. Texture is clay or gravelly clay. The content of clay ranges from 40 to 50 percent. The content of gravel is 3 to 20 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 10 percent. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 1 to 2 percent. Reaction ranges from moderately acid to neutral.

The BCt horizon has dry color of 10YR 5/6 or 7.5YR 5/4 or 5/6. Moist color is 7.5YR 4/6 or 5YR 3/4 or 4/6. Texture is clay loam or clay. The content of clay ranges from 35 to 45 percent. The content of gravel is 5 to 10 percent. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0 to 1 percent. Reaction is slightly acid or neutral.

The Argonaut taxadjunct is a taxadjunct because base saturation is less than is defined as the range for the series. This difference does not significantly affect the use, management, or interpretations of the soils

Auburn Series

The Auburn series consists of shallow, well drained soils that formed in material weathered from basic metavolcanic rocks. These soils are on metamorphic Sierra Nevada foothills. Slopes range from 3 to 75 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic Lithic Haploxerepts

Typical Pedon

Auburn loam, on a slope of 3 to 8 percent, at an elevation of 1,660 feet (503 m). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) loam, reddish brown (5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; slightly acid; abrupt smooth boundary.

Bw1—2 to 10 inches (5 to 25 cm); reddish brown (5YR 5/4) loam, reddish brown (5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; many fine and few very fine and medium tubular pores; slightly acid; abrupt irregular boundary.

Bw2—10 to 17 inches (25 to 43 cm); yellowish red (5YR 5/6) loam, reddish brown (5YR 4/4) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; many fine and few very fine and medium tubular pores; slightly acid; abrupt irregular boundary.

R—17 inches; indurated amphibolite schist bedrock.

Type location: Yuba County, California; about 3.6 miles northeast of Camp Far West Reservoir Dam, approximately 500 feet north and 500 feet east of the southwest corner of sec. 34, T. 15 N., R. 6 E.; 39 degrees, 6 minutes, 8 seconds north latitude and 121 degrees, 18 minutes, 3 seconds west longitude; NAD27; USGS Quad: Camp Far West, California.

Range in Characteristics

The depth to lithic contact ranges from 10 to 28 inches (25 to 71 cm) and is less than 20 inches (51 cm) in 50 percent or more of each pedon. The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The particle-size control section ranges from 12 to 25 percent clay. Mineralogy is mixed. By sum of cations, base saturation ranges from 60 to 85 percent. The content of organic matter is 1 to 2 percent to a depth of 17 inches (43 cm). The content of gravel is 2 to 15 percent, and the content of cobbles is 3 to 5 percent.

The A horizon has dry color of 7.5YR 5/4 or 4/4. Moist color is 7.5YR 4/4 or 3/4 or 5YR 4/4 or 3/4. Texture is loam or gravelly loam. The content of clay ranges from 12 to 25 percent. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 5YR 5/4 or 5/6. Moist color is 5YR 4/4 or 3/4. Texture is loam or gravelly loam. The content of clay ranges from 12 to 25 percent. Reaction ranges from moderately acid to neutral.

Beatsonhollow Series

The Beatsonhollow series consists of shallow, poorly drained soils that formed in residuum weathered from basalt. These soils are in swales on top of basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 2 to 5 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Lithic Haplohumults

Typical Pedon

Beatsonhollow gravelly loam, on a north-facing slope of 3 percent, under a cover of

annual grasses and forbs, at an elevation of 1,325 feet (404 m). When described on 10/18/2000, the soil was moist from 0 to 10 inches (0 to 25 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) gravelly loam, dark brown (7.5YR 3/2) moist; 18 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many fine roots throughout; many very fine irregular pores; 10 percent fine distinct irregular yellowish red (5YR 4/6 moist) oxidized iron masses in the matrix; 5 percent basalt cobbles and 15 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

A2—3 to 10 inches (8 to 25 cm); brown (10YR 4/3) cobbly loam, dark brown (7.5YR 3/2) moist; 22 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and medium roots throughout; common fine irregular pores; 10 percent basalt gravel and 20 percent basalt cobbles; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

Bt—10 to 17 inches (25 to 43 cm); brown (10YR 4/3) very cobbly loam, dark brown (7.5YR 3/2) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common fine and few medium roots throughout; common fine and few very fine tubular pores; 15 percent discontinuous faint clay films on surfaces along pores; 15 percent basalt gravel and 35 percent basalt cobbles; very strongly acid, pH 5.0 by Hellige-Truog; abrupt smooth boundary.

R—17 inches (43 cm); indurated basalt bedrock.

Type location: Butte County, California; about 5.5 miles north of Oroville, approximately 1,000 feet west and 1,000 feet south of the northeast corner of sec. 17, T. 20 N., R. 4 E.; 39 degrees, 35 minutes, 42.22 seconds north latitude and 121 degrees, 32 minutes, 34.3 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about May to November (about 150 to 200 days). The particle-size control section averages 22 to 29 percent clay and 35 to 65 percent rock fragments, mostly cobbles. Mineralogy is mixed. By sum of cations, base saturation ranges from 4 to 7 percent. A fluctuating water table can occur between the top of the bedrock and the surface of the soil from November through April. Rock fragments on the surface range from 10 to 20 percent gravel and 0 to 15 percent cobbles.

The A horizon has dry color of 7.5YR 3/4, 4/3, or 4/4 or 10YR 3/4, 4/3, 4/4, or 5/3. Moist color is 7.5YR 2/2, 3/2, or 3/3 or 10YR 2/2, 3/2, or 3/3. Texture is loam, gravelly loam, very gravelly loam, or cobbly loam. The content of clay ranges from 14 to 22 percent. The horizon has 10 to 25 percent gravel and 0 to 20 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 4/3 or 4/4 or 10YR 4/3 or 4/4. Moist color is 7.5YR 3/2, 3/3, or 3/4 or 10YR 3/2, 3/3, or 3/4. Texture is gravelly loam, very gravelly loam, extremely cobbly loam, cobbly loam, very cobbly loam, very cobbly clay loam, or extremely cobbly clay loam. The content of clay ranges from 20 to 29 percent. The horizon has 10 to 30 percent gravel and 5 to 45 percent cobbles. The content of organic matter is 1.5 to 8 percent. Reaction is moderately acid or strongly acid.

Beatsonhollow Taxadjunct

The Beatsonhollow taxadjunct consists of shallow, somewhat poorly drained soils that formed in residuum derived from basalt. These soils are on mounds on top of basalt plateaus on Sierra Nevada foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic Lithic Haplohumults

Typical Pedon

Beatsonhollow taxadjunct fine sandy loam, on a west-facing slope of 2 percent, under a cover of annual grasses and forbs, at an elevation of 500 feet (152 m). When described on 6/19/2001, the soil was dry to a depth of 10 inches (25 cm) and slightly moist from 10 to 18 inches (25 to 46 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); brown (7.5YR 5/4) fine sandy loam, brown (7.5YR 4/3) moist; 15 percent clay; strong thin platy structure; slightly hard, friable, nonsticky, nonplastic; many very fine roots; common very fine tubular pores; 20 percent very fine irregular oxidized iron masses; 10 percent subangular basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—1 to 6 inches (3 to 15 cm); strong brown (7.5YR 5/6) gravelly loam, dark brown (7.5YR 3/4) moist; 18 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 15 percent discontinuous distinct clay films on faces of peds; 20 percent subangular basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt2—6 to 10 inches (15 to 25 cm); strong brown (7.5YR 5/6) gravelly loam, dark brown (7.5YR 3/4) moist; 22 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 20 percent discontinuous distinct clay films on faces of peds; 20 percent subangular basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt3—10 to 15 inches (25 to 38 cm); brown (7.5YR 5/4) gravelly loam, dark reddish brown (5YR 3/4) moist; 25 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few fine and common very fine tubular pores; 25 percent discontinuous prominent clay films on faces of peds; 20 percent subangular basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt4—15 to 18 inches (38 to 46 cm); yellowish red (5YR 5/6) very gravelly loam, dark reddish brown (5YR 3/4) moist; 27 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few fine and common very fine tubular pores; 25 percent discontinuous prominent clay films on faces of peds; 40 percent subangular basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

R—18 inches (46 cm); indurated basalt bedrock.

Type location: Butte County, California; about 2.8 miles northwest of Oroville, on Sugarloaf Peak, approximately 200 feet west and 2,700 feet north of the southeast corner of sec. 3, T. 19 N., R. 3 E.; 39 degrees, 31 minutes, 54 seconds north latitude and 121 degrees, 36 minutes, 51 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control

section averages 18 to 27 percent clay and 20 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. By sum of cations, base saturation ranges from 4 to 7 percent. A fluctuating water table can occur between the top of the bedrock and a depth of 5 inches (13 cm) from November through April. Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 7.5YR 5/4 or 10YR 4/3 or 5/3. Moist color is 7.5YR 3/2, 3/3, or 4/3. Texture is fine sandy loam or gravelly loam. The content of clay ranges from 15 to 18 percent. The content of gravel is 5 to 20 percent. The content of organic matter is 4 to 8 percent. Redoximorphic features range from 10 to 20 percent oxidized masses of iron. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 5/4 or 5/6, 10YR 5/3 or 5/4, or 5YR 5/6. Moist color is 7.5YR 3/2, 3/3, 3/4, or 4/3 or 5YR 3/4. Texture is gravelly loam, loam, or very gravelly loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 5 to 40 percent. The content of organic matter is 1.5 to 5 percent. Redoximorphic features range from 0 to 10 percent oxidized masses of iron. Reaction ranges from strongly acid to slightly acid.

The Beatsonhollow taxadjunct in map unit 342 is a taxadjunct because the soil is on mounds, the particle-size control section is loamy, and the soil has an ochric epipedon. These differences do not significantly affect the use, management, or interpretations of the soil.

Beecee Series

The Beecee series consists of very deep, well drained soils that formed in tephra and colluvium derived from volcanic rocks over residuum derived from volcanic rocks. These soils are on side slopes on volcanic ridges in the Cascade Mountains. Slopes range from 30 to 70 percent. The mean annual precipitation is about 78 inches (1,981 mm), and the mean annual air temperature is about 50 degrees F (10 degrees C).

Taxonomic class: Medial-skeletal, mixed, mesic Typic Haploxerands

Typical Pedon

Beecee very gravelly medial loam, on an east-facing slope of 46 percent, under a cover of California black oak and scattered mixed conifers, at an elevation of 3,880 feet (1,183 m). When described on 11/30/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); leaves, needles, and twigs.

Oe—0.5 to 1 inch (1 to 2 cm); partially decomposed leaves, needles, and twigs.

A—1 inch to 4 inches (2 to 9 cm); yellowish brown (10YR 5/4) very gravelly medial loam, dark brown (7.5YR 3/2) moist; 19 percent clay; weak fine and medium subangular blocky structure parting to weak fine granular; soft, very friable, nonsticky, nonplastic; many very fine and fine and common medium roots; many very fine and fine tubular and common medium and coarse irregular pores; 35 percent subangular gravel; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.7; gradual smooth boundary.

Bt1—4 to 8 inches (9 to 20 cm); brown (7.5YR 5/4) very gravelly medial loam, dark brown (7.5YR 3/3) moist; 16 percent clay; weak fine subangular blocky structure parting to moderate very fine granular; soft, very friable, slightly sticky, nonplastic; many very fine to medium roots; many very fine and fine tubular and many medium irregular pores; few faint and distinct discontinuous clay films on faces of peds and in pores; 45 percent subangular gravel and 2 percent subangular cobbles; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.7; gradual smooth boundary.

Bt2—8 to 15 inches (20 to 37 cm); brown (7.5YR 5/4) very gravelly medial loam, dark brown (7.5YR 3/4) moist; 15 percent clay; weak medium subangular blocky structure parting to moderate fine granular; soft, very friable, slightly sticky, nonplastic; many very fine and fine, many medium, and common coarse roots; many very fine and fine tubular and many medium irregular pores; few faint discontinuous clay films on faces of peds and in pores; 55 percent subangular gravel and 3 percent subangular cobbles; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

Bt3—15 to 22 inches (37 to 55 cm); strong brown (7.5YR 4/6) extremely gravelly medial loam, reddish brown (5YR 4/3) moist; 16 percent clay; weak fine and medium subangular blocky structure parting to weak fine granular; slightly sticky, nonplastic; many very fine to medium roots; many very fine and fine tubular and many medium irregular pores; few faint discontinuous clay films on faces of peds and in pores; 65 percent subangular gravel and 5 percent subangular cobbles; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.4; gradual smooth boundary.

Bt4—22 to 31 inches (55 to 78 cm); reddish yellow (7.5YR 6/6) extremely gravelly loam, reddish brown (5YR 4/3) moist; 17 percent clay; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; many very fine to medium and common coarse roots; many very fine and fine tubular, common medium irregular, and common very coarse tubular pores; few faint discontinuous clay films on faces of peds and in pores; 65 percent subangular gravel and 3 percent subangular cobbles; strongly acid, pH 5.5 by meter 1:1 water; NaF pH 10.2; gradual smooth boundary.

Bt5—31 to 44 inches (78 to 111 cm); brownish yellow (10YR 6/6) very gravelly loam, brown (7.5YR 4/4) moist; 19 percent clay; moderate very fine granular structure; soft, very friable, slightly sticky, nonplastic; many very fine, many fine, and common medium and coarse roots; many very fine and fine tubular and common medium and coarse irregular pores; few faint discontinuous clay films on faces of peds and in pores; 45 percent subangular gravel and 3 percent subangular cobbles; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

2Bt6—44 to 59 inches (111 to 149 cm); yellowish brown (10YR 5/6) very gravelly loam, brown (7.5YR 4/4) moist; 24 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular and tubular and common medium irregular pores; many distinct discontinuous clay films on faces of peds and in pores; 45 percent subangular gravel, 5 percent subangular cobbles, and 5 percent subangular stones; strongly acid, pH 5.6 by pH meter 1:1 water; NaF pH 9.8; clear irregular boundary.

2Bt7—59 to 68 inches (149 to 172 cm); yellowish brown (10YR 5/8) very gravelly loam, brown (7.5YR 4/4) moist; 27 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; many distinct continuous clay films on faces of peds and in pores; 30 percent subangular gravel, 10 percent subangular cobbles, and 10 percent subangular stones; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 9.7; clear irregular boundary.

2Bt8—68 to 86 inches (172 to 218 cm); brownish yellow (10YR 6/6) very stony loam, brown (7.5YR 5/4) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; many distinct continuous clay films on faces of peds and in pores; 20 percent subangular gravel, 20

percent subangular cobbles, and 20 percent subangular stones; moderately acid, pH 5.8 by pH meter 1:1 water; NaF pH 9.6.

Type location: Butte County, California; about 2.2 miles southeast of Inskip, approximately 1,500 feet north and 850 feet east of the southwest corner of sec. 3, T. 24 N., R. 4 E.; 39 degrees, 57 minutes, 44.82 seconds north latitude and 121 degrees, 31 minutes, 5.65 seconds west longitude; NAD27; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 58 degrees F (11 to 14 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 12 to 18 percent clay and 35 to 70 percent rock fragments, mostly gravel. Mineralogy is mixed. Acid oxalate extractable Al plus ½ Fe ranges from 2 to 2.5 to a depth of 21.7 inches (55 cm). P retention ranges from 91 to 97 to a depth of 21.7 inches (55 cm). Rock fragments on the surface range from 15 to 40 percent gravel, 0 to 20 percent cobbles, 0 to 15 percent stones, and 0 to 10 percent boulders. Some pedons have a Bw horizon.

The A horizon has dry color of 5YR 6/4; 7.5YR 5/2, 5/3, 6/2, or 6/3; or 10YR 5/4. Moist color is 5YR 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/3, 3/4, or 4/3. Texture is gravelly medial loam, very gravelly medial loam, gravelly medial sandy loam, or very gravelly medial sandy loam. The content of clay ranges from 8 to 20 percent. The horizon has 25 to 40 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 10 to 15 percent. By sum of cations, base saturation ranges from 20 to 30 percent. By ammonium acetate, CEC ranges from 25 to 35. NaF pH is 10.0 to 11.0. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 5YR 5/4 or 6/4; 7.5YR 4/6, 5/4, 5/6, 6/3, 6/4, 6/6, or 7/6; or 10YR 6/4. Moist color is 5YR 3/3, 4/3, or 4/4; 7.5YR 3/3, 3/4, or 4/4; or 10YR 3/4 or 4/4. Texture is gravelly medial loam, very gravelly medial loam, extremely gravelly medial loam, gravelly medial sandy loam, very gravelly medial sandy loam, or extremely gravelly medial sandy loam. The content of clay ranges from 10 to 20 percent. The content of gravel is 20 to 70 percent. The content of cobbles is 0 to 20 percent. The content of stones also is 0 to 20 percent. The content of organic matter is 3 to 8 percent. By sum of cations, base saturation ranges from 8 to 13 percent. By ammonium acetate, CEC ranges from 18 to 25. NaF pH is 9.8 to 11.0. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 5YR 5/6 or 6/6; 7.5YR 6/6, 7/4, or 7/6; or 10YR 6/4, 6/6, or 7/6. Moist color is 5YR 4/3 or 4/6; 7.5YR 4/4, 5/4, or 5/6; or 10YR 4/4. Texture is gravelly loam, very gravelly loam, extremely gravelly loam, gravelly sandy loam, very gravelly sandy loam, very cobbly sandy loam, or extremely gravelly sandy loam. The content of clay ranges from 12 to 22 percent. The content of gravel is 20 to 75 percent, the content of cobbles is 0 to 30 percent, and the content of stones is 0 to 20 percent. The content of organic matter is 1 to 3 percent. By sum of cations, base saturation ranges from 15 to 25 percent. By ammonium acetate, CEC ranges from 16 to 21. NaF pH is 9.0 to 10.3. Reaction ranges from strongly acid to slightly acid.

The 2Bt horizon has dry color of 7.5YR 6/4 or 7/4 or 10YR 5/4, 5/6, 5/8, 6/3, 6/4, or 6/6. Moist color is 7.5YR 4/3, 4/4, or 5/4 or 10YR 3/4, 4/3, 4/4, or 5/4. Texture is very gravelly loam, very stony loam, very gravelly sandy loam, or very gravelly sandy clay loam. The content of clay ranges from 18 to 27 percent. The horizon has 20 to 60 percent gravel, 0 to 30 percent cobbles, and 0 to 30 percent stones. The content of organic matter is 0.2 to 1 percent. By sum of cations, base saturation ranges from 20

to 40 percent. By ammonium acetate, CEC ranges from 15 to 20. NaF pH is 9.0 to 10.0. Reaction ranges from very strongly acid to slightly acid.

Bigridge Series

The Bigridge series consists of deep, well drained soils that formed in colluvium and residuum derived from metavolcanic and metasedimentary rocks. These soils are on ridgetops and side slopes on Sierra Nevada foothills and mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Bigridge loam, on a north west-facing slope of 56 percent, under a cover of whiteleaf manzanita, toyon, interior live oak, and ponderosa pine, at an elevation of 2,000 feet (610 m). When described on 7/27/1999, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Oe—0 to 1 inch (0 to 3 cm); moderately decomposed plant material; abrupt smooth boundary.

A—1 to 5 inches (3 to 13 cm); brown (7.5YR 5/4) loam, dark reddish brown (5YR 3/3) moist; 16 percent clay; moderate fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many fine roots throughout; common fine tubular and common medium irregular pores; 15 percent subangular metavolcanic gravel; moderately acid, pH 5.7 by pH meter 1:1 water; abrupt wavy boundary.

BAt—5 to 9 inches (13 to 23 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (5YR 3/4) moist; 19 percent clay; strong fine subangular blocky structure; soft, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots throughout; many fine and common medium tubular pores; 20 percent discontinuous distinct clay films on faces of peds; 25 percent subangular metavolcanic gravel; moderately acid, pH 5.6 by pH meter 1:1 water; abrupt wavy boundary.

Bt1—9 to 15 inches (23 to 38 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (5YR 3/4) moist; 20 percent clay; strong fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and medium and few coarse roots throughout; many fine and common medium tubular pores; 20 percent discontinuous distinct clay films on faces of peds and 20 percent continuous distinct clay films on surfaces along pores; 20 percent subangular metavolcanic gravel; moderately acid, pH 5.8 by pH meter 1:1 water; clear wavy boundary.

Bt2—15 to 20 inches (38 to 51 cm); yellowish red (5YR 5/6) gravelly loam, dark red (2.5YR 3/6) moist; 21 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and few coarse roots throughout; common fine and few medium tubular pores; 40 percent continuous prominent clay films on surfaces along pores; 25 percent subangular metavolcanic gravel; moderately acid, pH 5.9 by pH meter 1:1 water; clear wavy boundary.

BCt1—20 to 27 inches (51 to 69 cm); yellowish red (5YR 5/6) very gravelly loam, dark reddish brown (2.5YR 3/4) moist; 20 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and coarse roots throughout; many fine and few medium tubular pores; 40 percent continuous prominent clay films on bottom surfaces of rock fragments; 50 percent

subangular metavolcanic gravel; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

BCt2—27 to 36 inches (69 to 91 cm); yellowish red (5YR 5/6) extremely gravelly loam, dark reddish brown (2.5YR 3/4) moist; 17 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine, common coarse, and few very coarse roots throughout; common fine tubular pores; 10 percent discontinuous faint clay films on faces of peds; 85 percent subangular metavolcanic gravel; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

BCt3—36 to 51 inches (91 to 129 cm); reddish yellow (7.5YR 7/6) very gravelly loam, yellowish red (5YR 5/8) moist; 18 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common fine to coarse roots throughout; few fine tubular pores; 60 percent continuous distinct clay films on surfaces along pores; 40 percent subangular metavolcanic gravel; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

Crt—51 to 62 inches (129 to 157 cm); vertically oriented, highly weathered, paralithic greenschist; few very fine and coarse roots in cracks; 60 percent continuous prominent clay films on rock fragments.

Type location: Butte County, California; about 6.25 miles northeast of Oroville Dam, approximately 1,300 feet west and 750 feet south of the northeast corner of sec. 9, T. 20 N., R. 5 E.; 39 degrees, 36 minutes, 41.47 seconds north latitude and 121 degrees, 24 minutes, 51.65 seconds west longitude; NAD83; USGS Quad: Oroville Dam, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 53 to 59 degrees F (12 to 14 degrees C). The soil moisture control section is dry in all parts from about June to October (about 120 days). The particle-size control section averages 18 to 27 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 4 percent to a depth of 15 inches (38 cm) and is less than 1 percent from a depth of 15 to 51 inches (38 to 129 cm). By sum of cations, base saturation is 39 to 50 percent from 9 to 20 inches (23 to 51 cm) and is 50 to 75 percent from 20 to 51 inches (51 to 129 cm). Rock fragments on the surface range from 0 to 30 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. In some pedons the lower part of the Bt horizon is silty clay with up to 50 percent clay. Some pedons do not have a BCt horizon.

The A horizon has dry color of 5YR 7/4 or 7/6; 7.5YR 4/2, 5/4, 6/4, or 7/4; or 10YR 6/3. Moist color is 5YR 2.5/1, 3/3, 3/4, 4/4, 5/4, or 4/6 or 7.5YR 4/3, 4/4, or 4/6. Texture is loam or gravelly loam with a high content of silt. The content of clay ranges from 15 to 25 percent. The content of gravel is 5 to 25 percent. Reaction ranges from moderately acid to neutral.

The BAt horizon has dry color of 7.5YR 5/4 or 6/6, 5YR 5/6 or 7/6, or 2.5YR 7/6. Moist color is 7.5YR 4/6, 5YR 3/4 or 4/6, or 2.5YR 3/6 or 5/6. Texture is gravelly loam, loam, clay loam, or gravelly clay loam with a high content of silt. The content of clay ranges from 19 to 30 percent. The content of gravel is 10 to 25 percent. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 5YR 5/6, 6/6, 6/8, 7/4, 7/6, 7/8, or 8/4; 2.5YR 4/8, 5/6, 6/6, 7/6, or 7/8; or 7.5YR 5/4 or 6/6. Moist color is 5YR 3/4, 3/6, 4/4, 4/6, 5/6, or 5/8 or 2.5YR 3/6, 4/6, 5/6, 6/6, or 5/8. Texture is gravelly loam, gravelly clay loam, loam, clay loam, or silty clay loam with a high content of silt. The content of clay ranges from 18 to 35 percent. The horizon has 5 to 25 percent gravel and 0 to 10 percent cobbles. Reaction ranges from very strongly acid to neutral.

The BCt horizon has dry color of 2.5YR 7/8, 5YR 5/6 or 6/6, or 7.5YR 7/6. Moist color is 2.5YR 3/4, 4/6, or 5/8 or 5YR 5/8. Texture is extremely gravelly loam, very gravelly clay loam, or extremely gravelly clay loam with a high content of silt. The content of clay ranges from 15 to 35 percent. The content of gravel is 40 to 85 percent. Reaction ranges from very strongly acid to slightly acid.

Billscabin Series

The Billscabin series consists of very deep, somewhat excessively drained soils that formed in colluvium and residuum weathered from quartz diorite. These soils are on side slopes on granitic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Typic Dystroxerepts

Typical Pedon

Billscabin gravelly sandy loam, on a northwest-facing slope of 51 percent, under a cover of mixed conifers, at an elevation of 4,575 feet (1,394 m). When described on 7/31/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed litter of needles, leaves, and twigs.

A1—2 to 5 inches (5 to 13 cm); dark grayish brown (10YR 4/2) gravelly sandy loam, very dark grayish brown (10YR 3/2) moist; 5 percent clay; weak very fine subangular blocky structure parting to single grain; loose, very friable, nonsticky, nonplastic; common very fine and fine roots; many very fine interstitial pores; 25 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.5; abrupt smooth boundary.

A2—5 to 14 inches (13 to 36 cm); pale brown (10YR 6/3) very gravelly sandy loam, brown (10YR 4/3) moist; 10 percent clay; weak fine subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; 40 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

Bw—14 to 27 inches (36 to 69 cm); very pale brown (10YR 7/3) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; 15 percent clay; weak fine subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; common very fine to coarse roots; common very fine tubular pores; common mica flakes; 36 percent gravel and 10 percent stones; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 10.0; abrupt smooth boundary.

C1—27 to 37 inches (69 to 94 cm); very pale brown (10YR 8/2) very gravelly loamy sand, light yellowish brown (10YR 6/4) moist; 3 percent clay; weak fine subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine interstitial pores; common mica flakes; 33 percent gravel and 2 percent stones; moderately acid, pH 5.8 by Hellige-Truog; clear wavy boundary.

C2—37 to 57 inches (94 to 145 cm); very pale brown (10YR 8/2) very gravelly loamy sand, light yellowish brown (10YR 6/4) moist; 3 percent clay; weak fine subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine interstitial pores; common mica flakes; 40 percent gravel and 2 percent stones; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 10.0; clear wavy boundary.

C3—57 to 82 inches (145 to 208 cm); very pale brown (10YR 8/3) very gravelly loamy sand, light yellowish brown (10YR 6/4) moist; 4 percent clay; weak fine subangular blocky structure parting to single grain; loose, nonsticky, nonplastic;

many very fine to medium roots; many very fine interstitial pores; common mica flakes; 37 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 10.0.

Type location: Butte County, California; about 1.9 miles south of Camel Peak Lookout, approximately 1,800 feet west and 2,350 feet north of the southeast corner of sec. 8, T. 21 N., R. 8 E.; 39 degrees, 41 minutes, 33 seconds north latitude and 121 degrees, 6 minutes, 17 seconds west longitude; NAD83; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 8 to 15 percent clay and 35 to 80 percent rock fragments, mostly gravel. Mineralogy is isotic. The content of organic matter is 2 to 4 percent from 2 to 5 inches (5 to 13 cm) and is less than 1 percent from 5 to 80 inches (13 to 203 cm). By ammonium acetate, base saturation ranges from 26 to 34 percent from 2 to 82 inches (5 to 208 cm). Rock fragments on the surface range from 0 to 50 percent cobbles, 0 to 50 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 10YR 5/2, 5/3, 5/4, 6/3, or 6/4. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 3/3 or 3/4. Texture generally is gravelly sandy loam and very gravelly sandy loam but in some pedons is very gravelly coarse sandy loam, very stony coarse sandy loam, coarse sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 5 to 15 percent. The horizon has 5 to 40 percent gravel, 0 to 20 percent cobbles, and 0 to 50 percent stones. NaF pH is 10.0 to 11.8. Reaction is moderately acid or slightly acid.

The Bw horizon has dry color of 10YR 4/4, 5/4, 5/6, 6/2, 6/4, 6/6, 7/2, 7/3, 7/4, or 8/3 or 2.5Y 7/6. Moist color is 10YR 3/3, 4/2, 4/3, 4/4, 5/2, 5/3, 5/4, or 6/4 or 2.5Y 5/4. Texture is extremely gravelly sandy loam, very gravelly coarse sandy loam, very cobbly sandy loam, extremely cobbly sandy loam, very gravelly sandy loam, or very stony coarse sandy loam. The content of clay ranges from 5 to 15 percent. The horizon has 10 to 40 percent gravel, 0 to 50 percent cobbles, and 0 to 20 percent stones. NaF pH is 9.0 to 11.0. Reaction ranges from strongly acid to slightly acid.

The C horizon has dry color of 10YR 7/6 or 8/2. Moist color is 10YR 5/4, 6/2, or 6/4. Texture is very gravelly loamy sand, extremely cobbly sandy loam, extremely cobbly coarse sandy loam, cobbly loamy coarse sand, gravelly loamy sand, or extremely stony sandy loam. The content of clay ranges from 3 to 12 percent. The horizon has 10 to 40 percent gravel, 0 to 50 percent cobbles, and 0 to 50 percent stones. NaF pH is 9.0 to 10.8. Reaction ranges from very strongly acid to moderately acid.

Blavo Series

The Blavo series consists of moderately deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 19 inches (483 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Very-fine, smectitic, thermic Xeric Duraquerts

Typical Pedon

Blavo clay, on a slope of less than 1 percent, under a cover of rice, at an elevation of 87 feet (26 m). When described on 5/7/1992, the soil was moist throughout. The water table was at a depth of 51 inches (130 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; 65 percent clay; strong very coarse prismatic structure parting to strong fine and medium angular blocky; hard, friable, very sticky, very plastic; many very fine roots; vertical cracks 0.5 inch to 1.5 inches (1.3 to 3.8 cm) wide and 6 to 12 inches (15 to 30 cm) apart; common fine and medium brown (7.5YR 4/4 moist) oxidized iron masses; noneffervescent; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bssg1—5 to 16 inches (13 to 41 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; 65 percent clay; strong very coarse prismatic structure parting to strong coarse angular blocky; extremely hard, firm, very sticky, very plastic; many very fine roots; common very fine tubular pores; vertical cracks 0.5 inch to 1.5 inches (1.3 to 3.8 cm) wide and 6 to 12 inches (15 to 30 cm) apart; many wedge-shaped aggregates 4 to 6 inches (10 to 15 cm) wide; many slickensides; common fine brown (7.5YR 4/4 moist) oxidized iron masses; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

Bssg2—16 to 24 inches (41 to 61 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; 65 percent clay; moderate coarse prismatic structure parting to strong medium and coarse angular blocky; extremely hard, firm, very sticky, very plastic; common very fine roots; common very fine tubular pores; many wedge-shaped aggregates 4 to 6 inches (10 to 15 cm) wide; many slickensides; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

Bkssg—24 to 30 inches (61 to 76 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; 60 percent clay; moderate medium and coarse angular blocky structure; very hard, friable, very sticky, very plastic; few very fine roots; many very fine tubular pores; many wedge-shaped aggregates 1 to 3 inches (2.5 to 7.6 cm) wide; many slickensides; disseminated carbonates; strongly effervescent; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

Bkg—30 to 36 inches (76 to 91 cm); gray (10YR 6/1) clay loam, dark gray (10YR 4/1) moist; 38 percent clay; strong fine and medium angular blocky structure; hard, friable, very sticky, very plastic; few very fine roots; many very fine tubular pores; many wedge-shaped aggregates 1 to 2 inches (2.5 to 5 cm) wide; common fine and medium irregular carbonate masses; violently effervescent; strongly alkaline, pH 8.5 by Hellige-Truog; abrupt wavy boundary.

2Bkqm—36 to 60 inches (91 to 152 cm); very pale brown (10YR 8/2), indurated duripan, brown (10YR 4/3) moist; massive; extremely hard, extremely firm; continuous indurated, silica-cemented laminar cap 15 to 25 mm thick; alternating layers of strongly cemented to indurated duripan to 60 inches; does not slake in HCl; many medium and coarse carbonate masses and many fine platelike black (N 2/0 moist) manganese masses at the top of the horizon; violently effervescent.

Type location: Butte County, California; about 3.2 miles southwest of Richvale, approximately 600 feet west and 2,350 feet north of the southeast corner of sec. 31, T. 19 N., R. 2 E.; 39 degrees, 29 minutes, 24 seconds north latitude and 121 degrees, 46 minutes, 57 seconds west longitude; NAD27; USGS Quad: West of Biggs, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from June to October (120 to 125 days). The particle-size control section averages 60 to 70 percent clay. Mineralogy is smectitic. The soils are calcareous from 15 to 34 inches (38 to 86 cm). Reversible, surface-initiated cracks 1 to 2 inches (2.5 to 5 cm) wide extend to a depth of 29 inches (74 cm) from May 15 to October 15 (150 days) when the soils are not irrigated. Few or common intersecting

slickensides are in the Bssg and Bkssg horizons, from 7 to 29 inches (18 to 74 cm). A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through May. Redoximorphic features, such as manganese nodules and oxidized iron masses with color of 7.5YR 4/4 moist and a reduced matrix with chroma of 1 moist, occur in the horizons above the duripan. Some pedons have overwash of silt loam from 6 to 20 inches (15 to 51 cm) thick.

The Ap horizon has dry color of 10YR 3/1 or 4/1. Moist color is 10YR 2/1 or 3/1. The content of clay ranges from 60 to 70 percent. The content of organic matter is 1 to 2 percent. Reaction ranges from moderately acid to neutral.

The Bssg horizon has dry color of 10YR 3/1, 4/1, or 5/1. Moist color is 10YR 3/1 or 4/1. The content of clay ranges from 65 to 70 percent. The content of organic matter is 0.5 to 2 percent. Reaction ranges from neutral to moderately alkaline.

The Bkssg horizon has dry color of 10YR 3/1, 4/1, or 5/1. Moist color is 10YR 3/1, 4/1, or 4/2. The content of clay ranges from 65 to 70 percent. The content of organic matter is 0.5 to 1 percent. Reaction is slightly alkaline or moderately alkaline.

The Bkg horizon has dry color of 10YR 5/1, 5/2, 6/1, 6/2, or 6/3. Moist color is 10YR 4/1, 4/2, or 5/2 or 2.5Y 4/2. Texture is clay loam or clay. The content of clay ranges from 35 to 60 percent. The content of organic matter is 0.1 to 0.5 percent. Reaction is moderately alkaline or strongly alkaline.

The 2Bkqm horizon has dry color of 10YR 5/2, 6/2, 7/2, 7/3, or 8/2. Moist color is 10YR 4/2, 4/3, or 5/2. Rupture resistance ranges from indurated to strongly cemented. The horizon has alternating weakly and moderately silica- and lime-cemented layers.

Boga Series

The Boga series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on terraces along the Feather River. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Boga loam, on a slope of less than 1 percent, in a field about to be leveled for peaches, at an elevation of 90 feet (27 m). When described on 8/15/1994, the soil was slightly moist below a depth of 6 inches (15 cm) because of nearby irrigation and irrigation canals. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 3 inches (0 to 8 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; 24 percent clay; moderate fine and medium subangular blocky structure; very hard, firm, nonsticky, slightly plastic; common very fine and few fine roots; many very fine and fine tubular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Ap2—3 to 6 inches (8 to 15 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; 25 percent clay; moderate coarse subangular blocky structure parting to medium subangular blocky; very hard, firm, nonsticky, slightly plastic; common very fine and few fine roots; many very fine and fine, common medium, and few coarse tubular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—6 to 14 inches (15 to 36 cm); pale brown (10YR 6/3) clay loam, brown (10YR 4/3) moist; 28 percent clay; weak medium subangular blocky structure; very hard, firm, slightly sticky, slightly plastic; common very fine and few fine roots; many very fine and fine, common medium, and few coarse tubular pores; few patchy

distinct clay films on faces of peds and in pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt2—14 to 29 inches (36 to 74 cm); light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; 30 percent clay; moderate medium subangular blocky structure; very hard, firm, slightly sticky, moderately plastic; common fine roots; many very fine and fine and common medium tubular pores; common discontinuous distinct clay films on faces of peds and in pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt3—29 to 53 inches (74 to 135 cm); light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; 28 percent clay; moderate medium subangular blocky structure; very hard, firm, slightly sticky, moderately plastic; few fine to coarse roots; many very fine and fine and common medium tubular pores; common discontinuous distinct clay films on faces of peds and in pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt4—53 to 73 inches (135 to 185 cm); light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; 26 percent clay; weak medium subangular blocky structure; very hard, firm, slightly sticky, moderately plastic; few fine to coarse roots; many very fine and fine and common medium tubular pores; few fine black (N 2/0 moist) irregularly shaped iron-manganese masses throughout; few discontinuous distinct clay films in root channels and pores; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

2Cd—73 to 80 inches (185 to 203 cm); dark yellowish brown (10YR 4/4) loam, olive brown (2.5Y 4/4) moist; 18 percent clay; noncemented; massive; extremely hard, friable, nonsticky, slightly plastic; no roots; many very fine and fine and few medium tubular pores; common fine and medium dark yellowish brown (10YR 4/4 moist) irregular and threadlike oxidized iron masses on fragment faces and in pores; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 2 miles southeast of Gridley, approximately 1,050 feet east and 150 feet north of the intersection of Larkin Road and Clardy Avenue; T. 17 N., R. 3 E.; in an unsectionized area in the Boga Land Grant; 39 degrees, 20 minutes, 31 seconds north latitude and 121 degrees, 39 minutes, 17 seconds west longitude; NAD27; USGS Quad: Gridley, California.

Range in Characteristics

The depth to densic material is 60 to 80 inches (152 to 203 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October (140 to 160 days). The particle-size control section averages 25 to 35 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 6 inches (15 cm). A fluctuating water table can occur between the top of the densic material and 20 inches (51 cm) below the surface of the soil from December through May.

The Ap horizon has dry color of 10YR 5/3, 5/4, or 6/3. Moist color is 10YR 4/3 or 4/2. Texture is loam or silt loam. The content of clay ranges from 18 to 27 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/3, 5/4, 5/6, 6/4, or 6/6. Moist color is 10YR 4/2, 4/3, 4/4, 5/3, or 5/4 or 7.5YR 4/3. Texture is loam, silt loam, silty clay loam, or clay loam. The content of clay ranges from 20 to 40 percent. The content of sand ranges from 15 to 50 percent. Redoximorphic features, such as iron-manganese masses (N 2/0 moist) and oxidized iron masses (10YR 4/6; 7.5YR 4/4, 4/6, or 5/6; 5YR 4/6; or 5/6 moist), occur below a depth of 40 inches (102 cm). Reaction ranges from slightly acid to slightly alkaline.

The 2Cd horizon has dry color of 2.5Y 7/4, 7/3, 6/4 or 10YR 4/4 or 6/4. Moist color is 2.5Y 4/4, 5/3, or 5/4 or 10YR 4/4. Texture is loam, silt loam, silt, very fine sandy loam, or fine sandy loam. The content of clay ranges from 5 to 20 percent.

Redoximorphic features, such as iron-manganese masses (N 2/0 moist) and oxidized iron masses (10YR 4/6; 7.5YR 4/4, 4/6, or 5/6; or 5YR 4/6 or 5/6 moist), occur in pores and on fragment faces. Rupture resistance ranges from slightly hard to very hard and varies within the horizon at any given point. The densic material does not slake in water, and the cementation class is noncemented. This material generally has many very fine and fine tubular pores that appear to be remnant root channels. Reaction ranges from slightly acid to moderately alkaline.

Bonepile Series

The Bonepile series consists of deep, well drained soils that formed in tephra over residuum derived from volcanic rocks. These soils are on the top of volcanic ridges in the Cascade Mountains. Slopes range from 2 to 30 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Medial-skeletal, glassy, frigid Typic Haploxerands

Typical Pedon

Bonepile gravelly medial loam, on a west-facing slope of 5 percent, under a cover of planted ponderosa pine, at an elevation of 5,140 feet (1,567 m). When described on 9/23/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); litter of needles and leaves.

A1—1 to 3 inches (3 to 8 cm); brown (7.5YR 5/2) gravelly medial loam, dark brown (7.5YR 3/2) moist; 18 percent clay; weak fine granular structure; loose, nonsticky, nonplastic; many very fine and common fine roots; many very fine and fine irregular and tubular pores; noneffervescent; 15 percent subangular gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

A2—3 to 9 inches (8 to 23 cm); brown (7.5YR 4/3) cobbly medial loam, dark brown (7.5YR 3/2) moist; 15 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine irregular and tubular pores; noneffervescent; 15 percent subangular gravel and 15 percent subangular cobbles; strongly acid, pH 5.1 by pH meter 1:1 water; NaF pH 11.0; gradual smooth boundary.

Bw1—9 to 18 inches (23 to 46 cm); brown (7.5YR 5/3) gravelly medial loam, dark brown (7.5YR 3/4) moist; 16 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine and few medium roots; many very fine and fine irregular and tubular pores; noneffervescent; 30 percent subangular gravel; very strongly acid, pH 5.0 by pH meter 1:1 water; NaF pH 10.9; gradual smooth boundary.

Bw2—18 to 30 inches (46 to 76 cm); brown (7.5YR 5/4) very gravelly medial loam, dark brown (7.5YR 3/4) moist; 16 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine, common fine and medium, and few coarse roots; many very fine and fine irregular and tubular pores; noneffervescent; 25 percent subangular gravel and 10 percent subangular cobbles; very strongly acid, pH 4.9 by pH meter 1:1 water; NaF pH 10.7; gradual smooth boundary.

2Bw3—30 to 44 inches (76 to 112 cm); brown (7.5YR 5/4) very gravelly medial loam, dark brown (7.5YR 3/4) moist; 23 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine and fine irregular and tubular pores; noneffervescent; 30 percent subangular gravel, 10 percent subangular

cobbles, and 10 percent subangular boulders; very strongly acid, pH 4.8 by pH meter 1:1 water; NaF pH 10.4; gradual smooth boundary.

2Cr—44 inches (112 cm); very weakly cemented andesite; roots occurring more than 4 inches (10 cm) apart.

Type location: Butte County, California; about 3 miles north of Inskip, approximately 600 feet north and 1,200 feet west of the southeast corner of sec. 9, T. 25 N., R. 4 E.; 40 degrees, 1 minute, 57 seconds north latitude and 121 degrees, 31 minutes, 35.3 seconds west longitude; NAD83; USGS Quad: Butte Meadows, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 41 to 47 degrees F (5 to 8 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 10 to 20 percent clay and 15 to 35 percent rock fragments, mostly gravel, in the upper part and 12 to 25 percent clay and 35 to 50 percent rock fragments, mostly gravel, in the lower part. Mineralogy is glassy. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.0 to 2.75 to a depth of 30 inches (76 cm). By ammonium acetate, CEC ranges from 35.5 in the A1 horizon to 16.4 in the 2Bw3 horizon. P retention ranges from 92 to 98 between 1 and 30 inches (2.5 to 76 cm). Rock fragments on the surface range from 5 to 35 percent gravel, 0 to 35 percent cobbles, 0 to 30 percent stones, and 0 to 30 percent boulders.

The A horizon has dry color of 7.5YR 4/2, 4/3, 4/4, 5/2, or 5/3 or 10YR 4/2, 5/2, or 5/4. Moist color is 7.5YR 3/2, 3/3, or 3/4; 5YR 3/2 or 3/3; or 10YR 2/2. Texture is gravelly or cobbly medial loam, gravelly or cobbly medial sandy loam, or gravelly or cobbly medial fine sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 15 to 35 percent gravel, 0 to 15 percent cobbles, and 0 to 10 percent stones. The content of organic matter is 10 to 15 percent. NaF pH is 10 to 11.5. Reaction ranges from strongly acid to slightly acid.

The upper part of the Bw horizon has dry color of 7.5YR 4/3, 4/4, 5/3, or 5/4. Moist color is 7.5YR 3/3 or 3/4 or 5YR 3/4 or 4/3. Texture is gravelly medial loam, gravelly medial sandy loam, gravelly medial fine sandy loam, or very gravelly medial sandy loam. The content of clay ranges from 10 to 20 percent. The content of gravel is 15 to 35 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 10 percent. The content of organic matter is 5 to 10 percent. NaF pH is 10.5 to 11.5. Reaction ranges from very strongly acid to slightly acid.

The lower part of the Bw horizon has dry color of 7.5YR 4/4, 5/4, or 6/4 or 10YR 5/4 or 4/4. Moist color is 7.5YR 3/4 or 4/3 or 10YR 4/4. Texture is gravelly or cobbly medial sandy loam, gravelly or cobbly medial fine sandy loam, gravelly or cobbly medial loam, or very gravelly or very cobbly medial loam. The content of clay ranges from 12 to 20 percent. The content of gravel is 20 to 50 percent, the content of cobbles is 0 to 30 percent, and the content of stones is 0 to 10 percent. The content of organic matter is 3 to 5 percent. NaF pH is 10.0 to 11.0. Reaction is very strongly acid or strongly acid.

The 2Bw horizon has dry color of 7.5YR 4/4, 5/3, 5/4, 5/6, 6/3, 6/4, 6/6, or 7/6 or 5YR 5/3 or 4/6. Moist color is 7.5YR 3/4 or 4/4 or 5YR 4/3, 4/4, or 4/6. Texture is gravelly or cobbly medial loam, gravelly or cobbly medial sandy loam, very gravelly or very cobbly medial loam, very gravelly or very cobbly medial sandy loam, or extremely gravelly or extremely cobbly medial sandy loam. The content of clay ranges from 15 to 25 percent. The horizon has 15 to 70 percent gravel, 0 to 30 percent cobbles, and 0 to 20 percent stones. The content of organic matter is 0.5 to 3 percent. NaF pH is 9.0 to 10.5. Reaction ranges from extremely acid to strongly acid.

Bonepile Taxadjunct

The Bonepile taxadjunct consists of deep, moderately well drained soils that formed in alluvium derived from volcanic rocks. These soils are on stream terraces in valleys in the Cascade Mountains. Slopes range from 2 to 8 percent. The mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 50 degrees F (10 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Ultic Haploxerands

Typical Pedon

Bonepile taxadjunct, on a south-facing slope of 2 percent, under a cover of incense cedar, ponderosa pine, white fir, Douglas-fir, and sugar pine, at an elevation of 4,395 feet (1,339 m). When described on 6/26/1997, the soil was very slightly moist to a depth of 7 inches (18 cm), dry from 7 to 37 inches (18 to 94 cm), and slightly moist below 37 inches (94 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A1—1 to 4 inches (3 to 10 cm); brown (7.5YR 5/3) gravelly medial sandy loam, dark brown (7.5YR 3/2) moist; 13 percent clay; weak fine and medium granular structure; loose, nonsticky, nonplastic; many very fine and fine and common medium roots; many very fine to medium irregular and tubular pores; 25 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 10.2; clear smooth boundary.

A2—4 to 7 inches (10 to 18 cm); light brown (7.5YR 6/3) very gravelly medial sandy loam, dark brown (7.5YR 3/2) moist; 15 percent clay; weak very fine granular structure; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine to medium tubular and irregular pores; 5 percent cobbles and 35 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; NaF pH 11.0; clear smooth boundary.

AB—7 to 15 inches (18 to 38 cm); light brown (7.5YR 6/3) very gravelly medial sandy loam, dark brown (7.5YR 3/2) moist; 17 percent clay; weak very fine granular structure; loose, slightly sticky, slightly plastic; many very fine to medium and few coarse roots; many very fine to medium tubular and irregular pores; 10 percent cobbles and 40 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

Bw1—15 to 30 inches (38 to 76 cm); yellowish brown (10YR 5/4) extremely gravelly sandy loam, brown (7.5YR 4/3) moist; 18 percent clay; weak very fine granular structure; loose, slightly sticky, slightly plastic; many very fine to coarse roots; many very fine to medium tubular and irregular pores; 10 percent stones, 20 percent cobbles, and 40 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

Bw2—30 to 37 inches (76 to 94 cm); pink (7.5YR 7/3) extremely cobbly sandy clay loam, brown (7.5YR 4/3) moist; 21 percent clay; weak fine subangular blocky structure; loose, slightly sticky, slightly plastic; many fine and medium roots; many very fine to medium tubular and irregular pores; 10 percent stones, 30 percent gravel, and 30 percent cobbles; neutral, pH 7.2 by Hellige-Truog; NaF pH 10.5; gradual smooth boundary.

2Bt—37 to 47 inches (94 to 119 cm); brown (7.5YR 4/3) extremely gravelly clay loam, brown (10YR 4/3) moist; 29 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine and medium roots; many very fine to medium tubular and irregular pores; 60 percent continuous distinct clay films; 20 percent coarse manganese

coatings; 10 percent stones, 30 percent cobbles, and 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.
2Bqm—47 inches (119 cm); moderately cemented duripan; 70 percent coarse manganese coatings.

Type location: Butte County, California; about 0.9 mile east of Butte Meadows, approximately 1,400 feet south and 1,870 feet east of the northwest corner of sec. 28, T. 26 N., R. 4 E.; 40 degrees, 4 minutes, 56 seconds north latitude and 121 degrees, 32 minutes, 4 seconds west longitude; NAD27; USGS Quad: Butte Meadows, California.

Range in Characteristics

Depth to the duripan is 40 to 60 inches (102 to 152 centimeters). The mean annual soil temperature is 47 to 50 degrees F (8 to 10 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 12 to 20 percent clay and 50 to 80 percent rock fragments. Mineralogy is isotic. A fluctuating water table can occur at a depth of 37 to 72 inches (94 to 183 centimeters) from December through June, 59 to 98 inches (150 to 249 centimeters) in July, 79 to 144 inches (200 to 365 centimeters) from August through October, and 59 to 144 inches (150 to 365 centimeters) in November. Redoximorphic features, such as manganese coatings, occur in the 2Bt and 2Bqm horizons. Rock fragments on the surface range from 10 to 40 percent gravel, 0 to 25 percent cobbles, 0 to 40 percent stones, and 0 to 20 percent boulders.

The A horizon has dry color of 7.5YR 4/3, 5/3, or 6/3 or 10YR 5/3. Moist color is 7.5YR 3/2 or 3/3 or 5YR 3/3. Texture is gravelly medial fine sandy loam, very gravelly medial fine sandy loam, gravelly medial sandy loam, very gravelly medial sandy loam, very stony medial sandy loam, or extremely stony medial sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 15 to 40 percent gravel, 0 to 25 percent cobbles, 0 to 25 percent stones, and 0 to 10 percent boulders. NaF pH is 10.0 to 11.5. Reaction is slightly acid or moderately acid.

The AB horizon has dry color of 7.5YR 5/3 or 6/3. Moist color is 7.5YR 3/2 or 3/3. Texture is very gravelly medial sandy loam, very gravelly medial loam, very cobbly medial sandy loam, or very stony medial sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 15 to 40 percent gravel, 5 to 20 percent cobbles, 0 to 25 percent stones, and 0 to 5 percent boulders. NaF pH is 10.0 to 11.0. Reaction is slightly acid or moderately acid.

The Bw horizon has dry color of 7.5YR 6/6 or 7/3 or 10YR 5/4. Moist color is 7.5YR 4/3. Texture is extremely gravelly sandy loam, extremely gravelly loam, extremely cobbly sandy clay loam, or extremely stony sandy loam. The content of clay ranges from 12 to 25 percent. The horizon has 15 to 40 percent gravel, 15 to 35 percent cobbles, 5 to 25 percent stones, and 0 to 5 percent boulders. NaF pH is 10.0 to 11.0. Reaction is slightly acid or neutral.

The 2Bt horizon has dry color of 7.5YR 4/3 or 10YR 5/6. Moist color is 10YR 4/3 or 4/4. Texture is extremely gravelly sandy loam, extremely gravelly loam, extremely gravelly sandy clay loam, extremely gravelly clay loam, or extremely stony sandy loam. The content of clay ranges from 15 to 30 percent. The horizon has 25 to 45 percent gravel, 15 to 35 percent cobbles, 5 to 25 percent stones, and 0 to 5 percent boulders. NaF pH is 9.0 to 10.0. Reaction is slightly acid or moderately acid.

The Bonepile taxadjunct is a taxadjunct because it is loamy-skeletal, has a mesic soil temperature regime, and is underlain by a duripan. These differences do not significantly affect the use, management, or interpretations of the soils.

Bonneyridge Series

The Bonneyridge series consists of very deep, somewhat excessively drained soils that formed in colluvium and residuum derived from quartz diorite. These soils are on ridgetops and side slopes on granitic Sierra Nevada mountains. Slopes range from 1 to 110 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Coarse-loamy, isotic, mesic Typic Dystroxerepts

Typical Pedon

Bonneyridge sandy loam, on an east-facing convex slope of 25 percent, under mixed conifers, at an elevation of 4,175 feet (1,272 m). When described on 9/25/1996, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 2.5 cm); fresh and slightly decomposed plant material.

A1—1 to 3 inches (2.5 to 7.6 cm); grayish brown (10YR 5/2) sandy loam, black (10YR 2/1) moist; 10 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine and fine roots; many very fine interstitial pores; common mica flakes; noneffervescent; 5 percent subrounded gravel; slightly acid, pH 6.5 by pH meter 1:1 water; NaF pH 12.0; abrupt smooth boundary.

A2—3 to 6 inches (7.6 to 15 cm); grayish brown (10YR 5/2) sandy loam, black (10YR 2/1) moist; 8 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine and medium roots; many very fine interstitial pores; common mica flakes; noneffervescent; 10 percent subrounded gravel; slightly acid, pH 6.5 by pH meter 1:1 water; NaF pH 11.5; abrupt smooth boundary.

Bw1—6 to 16 inches (15 to 41 cm); light brownish gray (10YR 6/2) coarse sandy loam, brown (10YR 4/3) moist; 6 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common fine and medium and few coarse roots; many very fine interstitial pores; common mica flakes; noneffervescent; 5 percent subrounded gravel; slightly acid, pH 6.3 by pH meter 1:1 water; NaF pH 11.0; clear smooth boundary.

Bw2—16 to 22 inches (41 to 56 cm); pale brown (10YR 6/3) coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few coarse roots; many very fine interstitial pores; common mica flakes; noneffervescent; 5 percent subrounded gravel; moderately acid, pH 5.8 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

Bw3—22 to 31 inches (56 to 79 cm); pale brown (10YR 6/3) coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few fine roots; many very fine interstitial pores; common mica flakes; noneffervescent; 10 percent subrounded gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.0; gradual smooth boundary.

Bw4—31 to 39 inches (79 to 99 cm); very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; 10 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few fine and medium roots; many very fine interstitial pores; common mica flakes; noneffervescent; slightly acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.0; gradual smooth boundary.

C1—39 to 56 inches (99 to 142 cm); very pale brown (10YR 7/3) loamy coarse sand, brown (10YR 5/3) moist; 5 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few fine and medium roots; many very fine interstitial pores; common mica flakes; noneffervescent;

moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

C2—56 to 76 inches (142 to 193 cm); very pale brown (10YR 8/2) gravelly loamy coarse sand, pale brown (10YR 6/3) moist; 5 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few fine and medium roots; many very fine interstitial pores; common mica flakes; noneffervescent; 16 percent subrounded gravel; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.0.

Type location: Plumas County, California; about 3 miles southeast of Cascade, approximately 1,100 feet north and 650 feet east of the southwest corner of sec. 18, T. 21 N., R. 8 E.; 39 degrees, 40 minutes 26.8 seconds north latitude and 121 degrees, 8 minutes, 0.2 second west longitude; NAD83; USGS Quad: Cascade, California.

Range in Characteristics

The depth to paralithic bedrock (quartz diorite) is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The soil moisture control section is dry in all parts from about July 1 to October 1 (about 90 days). The particle-size control section averages 5 to 18 percent clay and 4 to 10 percent rock fragments, mostly gravel. Mineralogy is isotic. By ammonium acetate, base saturation ranges from 55 to 100 percent from 10 to 30 inches (25 to 76 cm). Acid oxalate extractable Al plus ½ Fe ranges from 0.75 to 1.0 to a depth of 6 inches (15 cm). Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 10YR 5/2, 5/3, 5/4, 5/6, 6/2, 6/3, 6/4, or 8/2. Moist color is 10YR 2/1, 2/2, 3/2, 3/3, 4/2, 4/3, or 5/2. Texture is sandy loam, coarse sandy loam, gravelly sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 5 to 15 percent. The horizon has 0 to 25 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 2 to 8 percent. NaF pH is 10.0 to 12.0. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 10YR 6/2, 6/3, 6/4, 7/3, 7/4, 8/2, or 8/3 or 2.5Y 7/4. Moist color is 10YR 3/4, 4/3, 4/4, 4/6, 5/2, 5/3, 5/4, 5/6, 6/3, or 6/4 or 2.5Y 5/4 or 6/4. Texture is sandy loam, coarse sandy loam, gravelly sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 5 to 18 percent. The horizon has 0 to 30 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 0.6 to 6 percent. NaF pH is less than 9 to 11.5. Reaction ranges from strongly acid to slightly acid.

The C horizon has dry color of 10YR 6/2, 7/3, 7/4, 8/1, 8/2, or 8/3 or 2.5Y 7/4. Moist color is 10YR 4/2, 5/3, 5/4, 5/6, 6/3, 6/4, 6/6, 7/2, or 8/2 or 2.5Y 5/4 or 6/4. Texture is loamy coarse sand, gravelly loamy coarse sand, sandy loam, loamy sand, or gravelly sandy loam. The content of clay ranges from 5 to 18 percent. The content of gravel is 0 to 30 percent. The content of organic matter is 0.1 to 0.6 percent. NaF pH is less than 9.0 to 10.5. Reaction is strongly acid or moderately acid.

Bosquejo Series

The Bosquejo series consists of very deep, somewhat poorly drained soils that formed in alluvium weathered from volcanic rocks. These soils are in interfan basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Typic Haploxererts

Typical Pedon

Bosquejo clay, on a slope of less than 1 percent, under a cover of barley, at an elevation of 144 feet (44 m). When described on 6/16/1993, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 8 inches (0 to 20 cm); brown (7.5YR 5/2) clay, dark brown (7.5YR 3/2) moist; 47 percent clay; moderate coarse prismatic structure; hard, firm, very sticky, very plastic; common very fine roots; common very fine tubular pores; few fine black (N 2/0 moist) rounded iron-manganese concretions throughout; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bss1—8 to 19 inches (20 to 48 cm); brown (7.5YR 5/2) clay, dark brown (7.5YR 3/2) moist; 51 percent clay; moderate medium prismatic structure; hard, firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; common intersecting slickensides; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bss2—19 to 24 inches (48 to 61 cm); brown (7.5YR 4/2) clay, dark brown (7.5YR 3/2) moist; 54 percent clay; strong medium prismatic structure; hard, firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; common intersecting slickensides; very slightly effervescent throughout; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

2Bk—24 to 37 inches (61 to 94 cm); brown (7.5YR 5/2) silty clay, dark brown (7.5YR 3/4) moist; 43 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine roots; common very fine and few fine tubular pores; violently effervescent throughout; common fine cylindrical carbonate masses; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

2Bw1—37 to 44 inches (94 to 112 cm); brown (10YR 5/3) clay loam, dark brown (7.5YR 3/4) moist; 30 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine roots; common very fine tubular pores; very slightly effervescent throughout; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

2Bw2—44 to 46 inches (112 to 117 cm); brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; 22 percent clay; weak medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; very slightly effervescent throughout; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

2Bq—46 to 60 inches (117 to 152 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; 24 percent clay; weak fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine tubular pores; 5 percent fine rounded slightly cemented durinodes; few fine black (N 2/0 moist) iron-manganese nodules throughout; very slightly effervescent throughout; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 1.25 miles southeast of Nord, approximately 1,150 feet south and 150 feet east of the northwest corner of sec. 13, T. 22 N., R. 1 W.; 39 degrees, 45 minutes, 54 seconds north latitude and 121 degrees, 56 minutes, and 11 seconds west longitude; NAD27; USGS Quad: Nord, California.

Range in Characteristics

The soils are more than 60 inches (152 cm) deep. The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 130 to 150 days). The particle-size control section averages 40 to 50 percent clay. Mineralogy is smectitic. The content of organic matter is 1 to 5 percent to a depth of 24 inches (61 cm). Surface-initiated, reversible cracks 0.25 to 1 inch (0.6 to 2.5 cm) wide extend to a

depth of about 25 inches from May 15 to October 15 (about 150 days) when the soils are not irrigated. Intersecting slickensides occur in the Bss1 and Bss2 horizons, from about 6 to 30 inches (15 to 76 cm). A fluctuating water table can occur at a depth of 12 to 60 inches (30 to 152 cm) from December through May. Where they occur, redoximorphic features, such as oxidized iron masses with color of 7.5YR 3/4, 4/4, 4/6, or 5/6 moist, are in the 2Bw and 2Bq horizons and iron-manganese nodules are throughout the profile. Some pedons have overwash of silt loam 6 to 20 inches (15 to 51 cm) thick.

The Ap horizon has dry color of 7.5YR 4/2 or 5/2 or 10YR 4/2 or 5/2. Moist color is 7.5YR 3/2 or 4/2 or 10YR 3/2 or 3/3. Texture is most commonly clay, but the range includes silt loam and clay loam. The content of clay ranges from 18 to 50 percent. Reaction is slightly acid or neutral.

The Bss horizon has dry color of 7.5YR 4/2 or 5/2 or 10YR 4/2 or 5/2. Moist color is 7.5YR 4/2 or 5/2 or 10YR 4/2 or 5/2. Texture is clay or silty clay. The content of clay ranges from 40 to 55 percent. Reaction is neutral or slightly alkaline.

The 2Bk horizon has dry color of 7.5YR 5/2 or 5/3 or 10YR 5/2 or 5/3. Moist color is 7.5YR 3/3, 3/4, 4/3, or 4/4 or 10YR 3/3, 3/4, 4/3, or 4/4. Texture is clay loam, silty clay loam, or silty clay. The content of clay ranges from 30 to 45 percent. Reaction is slightly alkaline or moderately alkaline.

The 2Bw1 and 2Bw2 horizons have dry color of 7.5YR 5/2 or 5/3 or 10YR 5/2 or 5/3. Moist color is 7.5YR 3/4, 4/3, or 4/4 or 10YR 3/4, 4/3, or 4/4. Texture is clay loam or loam. The content of clay ranges from 20 to 35 percent. Reaction ranges from neutral to moderately alkaline.

The 2Bq horizon has dry color of 7.5YR 5/2 or 5/3 or 10YR 5/2 or 5/3. Moist color is 7.5YR or 10YR 3/4, 4/3, or 4/4. Texture is loam. The content of clay ranges from 18 to 27 percent. Reaction ranges from neutral to moderately alkaline.

Bosquejo Taxadjunct

The Bosquejo taxadjunct consists of deep or very deep, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are on stream terraces on Southern Cascade foothills. Slopes range from 0 to 2 percent. The mean annual precipitation is about 27 inches (686 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Chromic Haploxererts

Typical Pedon

Bosquejo taxadjunct, on a west-facing slope of 1 percent, under a cover of medusahead, lupine, clover, and plantain, at an elevation of 221 feet (67 m). When described on 4/10/2001, the soil was moist to a depth of 27 inches (69 cm) and slightly moist from 27 to 81 inches (69 to 206 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); grayish brown (10YR 5/2) clay, dark grayish brown (10YR 4/2) moist; 55 percent clay; strong fine and medium subangular blocky structure; extremely hard, friable, very sticky, very plastic; many very fine and fine roots; few very fine and fine tubular, many very fine to medium irregular, and common coarse irregular pores; 5 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

A2—3 to 8 inches (8 to 20 cm); grayish brown (10YR 5/2) clay, dark grayish brown (10YR 4/2) moist; 60 percent clay; strong coarse prismatic structure parting to strong medium and coarse subangular blocky; extremely hard, friable, very sticky, very plastic; common very fine and fine roots; common very fine to medium

tubular and irregular pores; 5 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bss1—8 to 17 inches (20 to 43 cm); dark grayish brown (10YR 4/2) clay, dark grayish brown (10YR 4/2) moist; 60 percent clay; strong medium and coarse subangular blocky structure; extremely hard, friable, very sticky, very plastic; common very fine roots; common very fine and fine tubular and irregular pores; 20 percent slickensides; 5 percent gravel; neutral, pH 7.3 by Hellige-Truog; gradual smooth boundary.

Bss2—17 to 27 inches (43 to 69 cm); grayish brown (10YR 5/2) clay, dark grayish brown (10YR 4/2) moist; 60 percent clay; strong fine and medium angular blocky structure; extremely hard, friable, very sticky, very plastic; few very fine roots; few very fine and fine tubular pores; 30 percent slickensides; 5 percent gravel; slightly alkaline, pH 7.8 by Hellige-Truog; clear irregular boundary.

2Btq1—27 to 33 inches (69 to 84 cm); pale brown (10YR 6/3) gravelly clay, yellowish brown (10YR 5/4) moist; 42 percent clay; strong fine and medium subangular blocky structure; extremely hard, friable, very sticky, very plastic; few very fine roots; few very fine and fine tubular pores; 60 percent continuous distinct clay films on faces of peds; 5 percent fine threadlike silica masses on surfaces along pores; 15 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

2Btq2—33 to 41 inches (84 to 104 cm); very pale brown (10YR 7/4) very gravelly sandy clay, yellowish brown (10YR 5/4) moist; 40 percent clay; massive; hard, friable, moderately sticky, moderately plastic; few very fine roots; common very fine and fine interstitial and tubular pores; 100 percent continuous distinct clay films; 10 percent fine threadlike silica masses on surfaces along pores; 1 percent cobbles and 60 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

2Btq3—41 to 55 inches (104 to 140 cm); pale brown (10YR 6/3) very gravelly sandy clay, yellowish brown (10YR 5/4) moist; 37 percent clay; massive; slightly hard, friable, moderately sticky, moderately plastic; few very fine roots; many very fine to medium interstitial pores; 100 percent continuous distinct clay films; 5 percent fine threadlike silica masses on surfaces along pores; 5 percent cobbles and 60 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

3Bdq1—55 to 70 inches (140 to 178 cm); very pale brown (10YR 8/3) sandy loam, yellowish brown (10YR 5/4) moist; 19 percent clay; massive parting to weak medium and coarse subangular blocky structure; hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium tubular pores; 5 percent fine threadlike silica masses lining pores; 1 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

3Bdq2—70 to 81 inches (178 to 206 cm); very pale brown (10YR 8/3) sandy loam, yellowish brown (10YR 5/4) moist; 16 percent clay; massive; hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium tubular pores; 1 percent coarse irregular silica masses around rock fragments; 2 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog;

Type location: Butte County, California; about 1.12 miles south-southwest of the intersection of Durham Pentz Road and Williams Road, approximately 290 feet north and 2,275 feet west of the southeast corner of sec. 32, T. 21 N., R. 3 E.; 39 degrees, 37 minutes, 33 seconds north latitude and 121 degrees, 39 minutes, 48 seconds west longitude; NAD83; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

The depth to densic material is 40 to 80 inches (102 to 203 cm). This material is underlain by volcanic sandstone. The mean annual soil temperature is 63 to 64

degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 180 days). The particle-size control section averages 40 to 60 percent clay and 0 to 25 percent rock fragments, mostly gravel. Mineralogy is smectitic. Surface-initiated, reversible cracks 1 to 2 inches (2.5 to 5 cm) wide extend to a depth of 25 to 35 inches (64 to 89 cm) from May through November (200 to 240 days) when the soils are not irrigated. A fluctuating water table can occur at a depth of 12 to 60 inches (30 to 152 cm) from December through April. Redoximorphic features, such as iron masses, occur in the A horizon. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 3 percent cobbles.

The A horizon has dry color of 10YR 4/2 or 5/2 or 7.5YR 5/2 or 6/2. Moist color is 10YR 4/2 or 7.5YR 4/2. Texture is clay or silty clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bss horizon has dry color of 10YR 4/2 or 7.5YR 5/3 or 6/3. Moist color is 10YR 4/2 or 7.5YR 4/3. Texture is clay or silty clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 10 percent. Reaction ranges from neutral to moderately alkaline.

The 2Btq horizon has dry color of 10YR 6/3, 6/4, 7/3, 7/4, 8/2, or 8/4 or 7.5YR 7/4. Moist color is 10YR 4/3, 5/3, or 5/4 or 7.5YR 4/3. Texture is gravelly clay, very gravelly sandy clay, extremely gravelly clay, extremely gravelly sandy clay loam, or extremely gravelly sandy clay. The content of clay ranges from 22 to 55 percent. The horizon has 0 to 90 percent gravel and 0 to 15 percent cobbles. Reaction ranges from neutral to strongly alkaline.

The 3Bdq horizon has dry color of 10YR 7/3, 7/4, or 8/3. Moist color is 10YR 4/3 or 5/4. Texture is sandy loam, sandy clay loam, or extremely gravelly sandy clay. The content of clay ranges from 15 to 40 percent. The horizon has 0 to 60 percent gravel and 0 to 20 percent cobbles. Reaction ranges from neutral to strongly alkaline.

The Bosquejo taxadjunct is a taxadjunct because it has a gravelly substratum and has densic contact within a depth of 60 inches. These differences do not significantly affect the use, management, or interpretations of the soils.

Bottlehill Series

The Bottlehill series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from metavolcanic and metasedimentary rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 110 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic Xeric Haplohumults

Typical Pedon

Bottlehill very gravelly loam, on a south-facing slope of 7 percent, under a cover of mixed conifers, greenleaf manzanita, and prostrate ceanothus, at an elevation of 5,180 feet (1,579 m). When described on 9/23/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); litter of needles and leaves.
Oe—0.5 inch to 2 inches (1 to 4 cm); partially decomposed litter of needles and leaves.
A1—2 to 4 inches (4 to 11 cm); brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; 18 percent clay; moderate fine granular structure; soft, very friable, nonsticky, nonplastic; many very fine and fine and common medium roots; many very fine and fine irregular and tubular pores; 35

percent subangular gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 9.6; clear smooth boundary.

A2—4 to 9 inches (11 to 22 cm); brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; 18 percent clay; weak fine granular structure; soft, very friable, nonsticky, nonplastic; many very fine and fine and common medium and coarse roots; many very fine and fine irregular and tubular pores; 45 percent subangular gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 10.2; clear smooth boundary.

Bt1—9 to 13 inches (22 to 32 cm); very pale brown (10YR 7/4) very gravelly loam, brown (7.5YR 5/4) moist; 21 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine, common medium, and few coarse roots; common very fine and fine irregular and tubular pores; many distinct discontinuous clay films on faces of peds and in pores; 40 percent subangular gravel; strongly acid, pH 5.2 by pH meter 1:1 water; NaF pH 9.9; abrupt wavy boundary.

Bt2—13 to 22 inches (35 to 55 cm); very pale brown (10YR 8/4) very gravelly loam, yellowish brown (10YR 5/6) moist; 26 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine and fine irregular and tubular pores; many distinct continuous clay films on faces of peds and in pores; 50 percent subangular gravel and 10 percent subangular metamorphic cobbles; very strongly acid, pH 4.8 by pH meter 1:1 water; NaF pH 9.6; gradual smooth boundary.

Bt3—22 to 33 inches (55 to 85 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, yellowish brown (10YR 5/6) moist; 31 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine and fine irregular and tubular pores; common distinct continuous clay films on faces of peds and in pores; 55 percent subangular gravel and 20 percent subangular cobbles; very strongly acid, pH 4.9 by pH meter 1:1 water; NaF pH 9.6; abrupt smooth boundary.

R—33 inches (85 cm); very strongly cemented metavolcanic rock; vertical beds 1 to 2 inches (2.5 to 5 cm) thick.

Type location: Butte County, California; about 2.1 miles north of Inskip, approximately 1,850 feet north and 1,350 feet east of the southwest corner of sec. 16, T. 25 N., R. 4 E.; 40 degrees, 1 minute, 18 seconds north latitude and 121 degrees, 32 minutes, 9.5 seconds west longitude; NAD83; USGS Quad: Butte Meadows, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 47 to 56 degrees F (8 to 13 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 18 to 30 percent clay and 35 to 65 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 35 to 75 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 5 percent boulders. Some pedons have tephra-influenced A horizons.

The A horizon has dry color of 10YR 5/3, 6/2, 6/3, 6/4, or 7/3 or 7.5YR 6/3. Moist color is 10YR 3/2 or 4/3 or 7.5YR 4/3. Texture is very gravelly loam or very gravelly sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 35 to 60 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 10 to 20 percent. By sum of cations, base saturation ranges from 20 to 40 percent. Reaction ranges from strongly acid to slightly acid.

The upper part of the Bt horizon has dry color of 10YR 7/3, 7/4, 8/3, or 8/4 or 7.5YR 7/4. Moist color is 10YR 4/4, 5/4, or 5/6 or 7.5YR 4/3, 4/4, 4/6, 5/4, or 5/6.

Texture is very gravelly loam, very gravelly sandy loam, or extremely gravelly loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 35 to 70 percent, the content of cobbles is 0 to 15 percent, and the content of stones is 0 to 5 percent. The content of organic matter is 1.5 to 10 percent. By sum of cations, base saturation ranges from 10 to 20 percent. Reaction ranges from very strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 10YR 7/4, 8/3, or 8/4. Moist color is 10YR 5/4, 5/6, 5/8, or 6/4 or 7.5YR 5/4. Texture is very gravelly loam, very gravelly sandy clay loam, very gravelly clay loam, extremely gravelly loam, or extremely gravelly clay loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 55 to 75 percent, the content of cobbles is 0 to 30 percent, and the content of stones is 0 to 30 percent. The content of organic matter is 0.5 to 3 percent. By sum of cations, base saturation ranges from 10 to 20 percent. Reaction ranges from very strongly acid to slightly acid.

Boxrobber Series

The Boxrobber series consists of shallow, well drained soils that formed in residuum and colluvium derived from ultramafic rocks. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 52 inches (1,321 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic, shallow Ultic Haploxeralfs

Typical Pedon

Boxrobber cobbly sandy clay loam, on a south-facing slope of 29 percent, under a cover of whiteleaf manzanita, foothill pine, blue oak, toyon, canyon live oak, and buckbrush, at an elevation of 2,340 feet (713 m). When described on 10/19/2000, the soil was moderately dry to a depth of 16 inches (41 cm) and dry below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pink (7.5YR 7/3) cobbly sandy clay loam, brown (7.5YR 5/3) moist; 25 percent clay; moderate fine and medium subangular blocky structure parting to moderate fine and medium granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to medium tubular and irregular pores; 10 percent gravel and 15 percent cobbles; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); pink (7.5YR 7/4) very gravelly sandy clay loam, brown (7.5YR 5/4) moist; 30 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium and few coarse roots; many very fine to medium tubular pores; 60 percent discontinuous distinct clay films; 15 percent cobbles and 25 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bt2—8 to 16 inches (20 to 41 cm); light brown (7.5YR 6/4) very gravelly clay loam, strong brown (7.5YR 4/6) moist; 35 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 20 percent cobbles and 35 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; clear wavy boundary.

Crt—16 to 30 inches (41 to 76 cm); white (2.5Y 8/1), weakly cemented bedrock, pale yellow (2.5Y 7/3) moist; few very fine and fine roots; 20 percent continuous prominent clay films; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

R—30 inches (76 cm); white (5Y 8/1), very strongly cemented bedrock, pale olive (5Y 6/3) moist; few very fine to medium roots; neutral, pH 6.8 by Hellige-Truog.

Type location: Butte County, California; about 0.75 mile east of Concow School, approximately 1,200 feet north and 2,400 feet west of the southeast corner of sec. 27, T. 22 N., R. 4 E.; 39 degrees, 43 minutes, 48 seconds north latitude and 121 degrees, 30 minutes, 50 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 54 to 59 degrees F (12 to 15 degrees C). The particle-size control section averages 27 to 35 percent clay and 35 to 50 percent rock fragments, mostly gravel. Mineralogy is mixed but is affected by magnesium-rich minerals in the series control section. Rock fragments on the surface range from 5 to 60 percent gravel, 5 to 30 percent cobbles, 5 to 20 percent stones, and 3 to 15 percent boulders.

The A horizon has dry color of 7.5YR 6/4, 7/3, 7/4, or 8/3. Moist color is 7.5YR 4/3, 5/3, or 5/4. Texture is cobbly sandy clay loam, gravelly sandy clay loam, cobbly loam, gravelly loam, or very cobbly loam. The content of clay ranges from 22 to 30 percent. The horizon has 10 to 15 percent gravel, 0 to 25 percent cobbles, and 0 to 5 percent stones. Reaction is neutral or slightly acid.

The Bt horizon has dry color of 7.5YR 6/4, 7/4, 7/6, or 8/4. Moist color is 7.5YR 3/4, 4/4, 4/6, 5/4, or 6/6. Texture is very gravelly sandy clay loam, very gravelly clay loam, gravelly clay loam, or very cobbly clay loam. The content of clay ranges from 27 to 35 percent. The horizon has 15 to 35 percent gravel, 0 to 25 percent cobbles, and 0 to 5 percent stones. Reaction is neutral or slightly acid.

Busacca Series

The Busacca series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on distal alluvial fans. Slopes are 0 to 1 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Pachic Haploxerolls

Typical Pedon

Busacca clay loam, on a slope of less than 1 percent, under a cover of irrigated pasture grasses, at an elevation of 157 feet (48 m). When described on 7/20/1993, the soil was slightly moist to a depth of 72 inches (183 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 3 inches (0 to 8 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 35 percent clay; moderate medium platy structure; extremely hard, slightly rigid, moderately sticky, very plastic; common very fine and few fine and medium roots; common very fine and fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

A—3 to 8 inches (8 to 20 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 35 percent clay; strong coarse prismatic structure parting to strong fine and medium granular; extremely hard, slightly rigid, moderately sticky, very plastic; common very fine and few fine and medium roots; common very fine and fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bw1—8 to 16 inches (20 to 41 cm); brown (10YR 4/3) clay loam, dark brown (10YR 3/3) moist; 35 percent clay; strong coarse prismatic structure parting to strong

fine angular blocky; extremely hard, slightly rigid, moderately sticky, very plastic; common very fine and few fine and medium roots; few very fine and fine tubular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Bw2—16 to 28 inches (41 to 71 cm); brown (10YR 4/3) silty clay loam, dark brown (10YR 3/3) moist; 37 percent clay; moderate medium prismatic structure parting to strong fine angular blocky; hard, very firm, moderately sticky, very plastic; common very fine roots; common very fine and few fine tubular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Bw3—28 to 43 inches (71 to 109 cm); brown (10YR 5/3) silty clay loam, dark brown (10YR 3/3) moist; 35 percent clay; moderate fine angular blocky structure; very hard, extremely firm, moderately sticky, very plastic; few very fine roots; few fine and common very fine tubular pores; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bw4—43 to 60 inches (109 to 152 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; 33 percent clay; weak fine angular blocky structure; moderately hard, firm, slightly sticky, moderately plastic; few very fine roots; few very fine tubular pores; few fine round black (N 2/0 moist) iron-manganese concretions throughout; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bw5—60 to 72 inches (152 to 183 cm); brown (10YR 5/3) clay loam, brown (10YR 4/3) moist; 29 percent clay; weak fine subangular blocky structure; moderately hard, firm, slightly sticky, moderately plastic; few very fine roots; common very fine and fine tubular pores; throughout the horizon, few fine round black (N 2/0 moist) iron-manganese concretions with sharp boundaries; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 2.5 miles east of Durham, approximately 2,800 feet east and 100 feet south of the intersection of Durham Highway and Esquon Road; T. 21 N., R. 2 E.; in an unsectionized area in the Esquon Land Grant; 39 degrees, 38 minutes, 44 seconds north latitude and 121 degrees, 45 minutes, 12 seconds west longitude; NAD27; USGS Quad: Chico, California.

Range in Characteristics

The thickness of the mollic epipedon is 20 to 35 inches (51 to 89 cm). The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The soil moisture control section is dry from July to November (120 to 125 days). The particle-size control section averages 35 to 40 percent clay. Mineralogy is mixed. Surface-initiated, reversible cracks 1/8 to 1/2 inch wide extend to a depth of 28 inches (71 cm) from about May 15 to October 15 (140 to 160 days) when the soils are not irrigated. A fluctuating water table can occur between depths of 30 (76 cm) and more than 80 inches (203 cm) from December through April. Some pedons have lime below a depth of 28 inches (71 cm).

The A horizon has dry color of 10YR 4/1, 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/1, 3/2, or 3/3. The content of clay ranges from 30 to 40 percent. The content of organic matter is 2 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bw horizon has dry color of 10YR 4/3, 5/2, 5/3, 6/2, or 6/3. Moist color is 10YR 3/2, 3/3, 4/2, or 4/3. Texture is clay loam, silty clay loam, or clay. The content of clay ranges from 35 to 42 percent. The content of organic matter is 0.2 to 2 percent. Reaction is neutral or slightly alkaline.

The lower part of the Bw horizon has dry color of 10YR 5/3, 6/3, 6/4, 7/3, or 7/4. Moist color is 10YR 3/3, 4/2, 4/3, 4/4, 5/3, or 5/4 or 7.5YR 4/3 or 4/4. Texture is clay loam or loam. The content of clay ranges from 25 to 35 percent. This part of the Bw horizon has redoximorphic features, such as oxidized iron masses and iron manganese concentrations. The content of organic matter is 0.1 to 1 percent. Reaction ranges from neutral to strongly alkaline.

Butteside Series

The Butteside series consists of moderately deep, moderately well drained soils that formed in residuum and colluvium derived from volcanic rocks. These soils are on ridgetops and side slopes on Cascade foothills. Slopes range from 2 to 35 percent. The mean annual precipitation is about 27 inches (686 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Butteside gravelly loam, on a west-facing slope of 25 percent, under a cover of annual grasses and forbs, at an elevation of 265 feet (81 m). When described on 5/10/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pale brown (10YR 6/3) gravelly loam, dark grayish brown (10YR 4/2) moist; 23 percent clay; moderate thick platy structure parting to moderate medium and coarse subangular blocky; extremely hard, firm, slightly sticky, slightly plastic; many very fine roots; few very fine and fine tubular and irregular pores; 20 percent distinct threadlike strong brown (7.5YR 5/6) oxidized iron masses in pores; 1 percent chert gravel and 14 percent volcanic gravel; slightly acid, pH 6.6 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); brown (7.5YR 5/3) clay loam, brown (7.5YR 4/3) moist; 32 percent clay; moderate medium and coarse prismatic structure parting to moderate medium angular blocky; very hard, firm, moderately sticky, moderately plastic; common very fine roots; common fine and medium irregular and few very fine tubular pores; 80 percent continuous distinct clay films on faces of peds; 1 percent chert gravel and 9 percent volcanic gravel; neutral, pH 6.9 by Hellige-Truog; clear smooth boundary.

Bt2—8 to 13 inches (20 to 33 cm); brown (10YR 5/3) clay loam, brown (10YR 4/3) moist; 38 percent clay; strong fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine and fine and few medium irregular and tubular pores; 85 percent continuous distinct clay films on faces of peds; 1 percent chert gravel and 4 percent volcanic gravel; neutral, pH 6.9 by Hellige-Truog; abrupt smooth boundary.

Bt3—13 to 27 inches (33 to 69 cm); pale brown (10YR 6/3) clay, brown (10YR 4/3) moist; 50 percent clay; strong medium and coarse prismatic structure parting to strong fine, medium, and coarse angular blocky; extremely hard, firm, very sticky, very plastic; common very fine roots; many very fine to medium irregular and common very fine and fine tubular pores; 90 percent continuous distinct clay films on faces of peds; 1 percent chert gravel, 1 percent volcanic gravel, and 5 percent sandstone cobbles; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

2Crtq—27 inches (69 cm); very pale brown (10YR 8/3), moderately cemented volcanic sandstone bedrock, light yellowish brown (10YR 6/4) moist; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 1.25 miles south of Durham-Pentz Road and 0.5 mile west of Clark Road, approximately 100 feet south and 1,800 feet east of the northwest corner of sec. 4, T. 20 N., R. 3 E.; 39 degrees, 37 minutes, 30 seconds north latitude and 121 degrees, 38 minutes, 44 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 60 to 68 degrees F (16 to 20 degrees C). The particle-size

control section averages 35 to 50 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. Redoximorphic features, such as masses of oxidized iron with color of 7.5YR 5/6, occur in the A horizon. Rock fragments on the surface range from 0 to 15 percent gravel, 0 to 25 percent cobbles, 0 to 10 percent stones, and 0 to 1 percent boulders.

The A horizon has dry color of 10YR 4/2, 6/2, or 6/3 or 7.5YR 5/2 or 6/3. Moist color is 10YR 4/2 or 3/2 or 7.5YR 4/2 or 3/2. Texture is gravelly loam, gravelly clay loam, or sandy clay loam. The content of clay ranges from 22 to 38 percent. The horizon has 2 to 20 percent gravel and 0 to 5 percent cobbles.

The Bt horizon has dry color of 10YR 5/2, 5/3, 6/3, 7/3, or 7/4 or 7.5YR 4/2, 5/2, or 5/3. Moist color is 10YR 4/2 or 4/3 or 7.5YR 4/2 or 4/3. Texture is gravelly clay loam, cobbly clay loam, clay loam, sandy clay loam, sandy clay, gravelly clay, very gravelly clay, or clay. The content of clay ranges from 30 to 50 percent. The horizon has 2 to 25 percent gravel and 0 to 15 percent cobbles. Reaction ranges from slightly acid to strongly alkaline.

Calcic Haploxerolls

Calcic Haploxerolls consist of moderately deep or deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on knolls on low terraces at the edge of basins. Slope ranges from 0 to 2 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Mixed, superactive, thermic Calcic Haploxerolls

Typical Pedon

Calcic Haploxerolls sandy loam, on a slope of 1 percent, in a fallow field at an elevation of 72 feet (22 m). When described on 9/22/1988, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 5 inches (0 to 13 cm); dark grayish brown (10YR 4/2) sandy loam, very dark brown (10YR 2/2) moist; 15 percent clay; moderate fine and medium granular structure; soft, very friable, nonsticky, slightly plastic; many fine and few medium roots; many very fine and common fine tubular pores; many wormcasts; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

Ak—5 to 17 inches (13 to 43 cm); grayish brown (10YR 5/2) sandy loam, very dark grayish brown (10YR 3/2) moist; 15 percent clay; moderate fine subangular blocky structure; soft, friable, slightly sticky, slightly plastic; few very fine roots; common very fine and few fine tubular pores; finely disseminated carbonates; violently effervescent; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.
